Hi Kent.

My comments for what they are worth.

I was also worried about the square hole but what I did was to print out the top panel provided in the instructions after adding or subtracting any wording or pictures. Bear in mind when you do that to make sure that it is set to print at original size, not a default setting when printing a PDF. Then cut out the square on the printed sheet with a sharp knife or scalpel and laminate it. That means that you get a nice square edge covering the one in the case and the laminating after the cutout means there is a window over the display. It looks very nice.

I cut the case with a Dremel using a disk after drilling the corners, it is really no problem.

The only other major thing to look out for is to make sure the windings really are tinned, check with a meter. It takes a hot iron!

A slow motion drive was the only other thing I added, it makes a difference.

Someone in the group, usually Steve will always answer your questions.

All the best,

John.

Hi Kent

Although I messed up my hole positioning on the side of the case, I got the front OK.

I drilled 4 holes along each long edge then cut along with a metal saw. A few more holes along the short sides and the bulk of the metal was gone. I tidied the opening up with a flat file

You can see my efforts with the case on my blog

Like wise drill a series of holes and file carefully. Support the hole with two pieces of wood. Make sure that you don't make the holes back to front (easily done), use the screw holes as datum points. You can use a DVD/CD marker pen to mark things out.

Thanks Owen for the great idea about clamping with wood pieces. I was working on a very small enclosure and it wasn't in a stable setup and it moved around on me. I use to work in a fully equipped shop with all kind of tools. Now that I am retired, I have kind of a meager arrangement that I need to be smart about equipping (for not much money).

One tool that I have found extremely useful for this type of project is a tapered hand reamer which you can get from eBay for about $8.00,- brilliant for carefully enlarging holes. Also keep an eye on the Aldi store. Over here in UK they sell tools at a very reasonable price.

From: vk4apn
Topic: 2215 Message: 2215

have posted a photo of completed amplifier.

Works very very well and was well worth the effort to build. Can recommend to others who might like a little more power.

Many thanks to PA0RCL for his excellent info and PCB layout - fortunately, I use same PCB software so easily altered to suit parts on hand.

Apologies if I have double posted this - I thought I posted yesterday but may have pushed wrong button?

Hello Harya,

What do you mean by the "reff", is this the 5V supply?

Measure the 5V supply - is it 5V, if not is the regulator getting hot?
If yes you have a partial short somewhere on the 5V line, if its cold
either the regulator is faulty or fitted back to front.

Do you have 12V on the input to the regulator?

Reff is from voltage table
pin 17 of IC 2 should be 3.7 V not 1,7 V

The Regulator is 12 Volt

From: Steve Drury
Topic: 2216 Message: 2219

OK I understand now.

Check the value of R33 and R21, if these are OK check that there are no solder blobs or similar across the PCB track. If all OK remove the micro and check the voltage at pin 17 again.

Let me know how you get on.

Regards,
Steve G6ALU

Harya,

Pull the IC out of the socket and then measure the voltage, if its correct
then the IC is at fault and I will send you another.

Regards,
Steve G6ALU

2223. Just finished a Digital SWR meter build from Radio-Kits

Yahoo group: mkars80
Date: 2011-08-26 15:19:01 UTC
From: Philip
Topic: 2223 Message: 2223

Another great kit fro Radio-Kits, easy to build
and a bargain considering the number of components
and quality PCB.

Built it to complement my MKARS80 with CW addon and
it works exactly as it says on the tin.
The power meter is going to be a godsend whilst tweaking
my many QRP TX projects.....

Great fun :)

Regards
Philip G4JVF

Harya,

I received your email - I tried to reply but Yahoo said you didn't have
an account!

The chip will be posted today - I do not know how long it will take to
arrive with you in Indonesia but the radio should work in this condition.

Regards,
Steve G6ALU

Harya,

I received your email - I tried to reply but Yahoo said you didn't have

an account!

The chip will be posted today - I do not know how long it will take to

arrive with you in Indonesia but the radio should work in this condition.

Regards,

Steve G6ALU

From: sugrob19
Topic: 2228 Message: 2228

Hi all!
There is a need in parameters the variable-capacitance C57.
Please, specify the characteristics of the C57.
Thank you for your attention.

2229. Re: [mkars80] Help! C-57

Hi Kent.
The basic answer is to use a neutral one which does not smell of acetic acid as it cures.
In the UK Servisol is a very good one and that's what I used.

Please remember to remove all enamel from the wires by tinning with a very hot iron before fitting. Most problems with the transceiver are caused by poor joints on the windings.
It's a good idea to check with a meter after tinning if possible.

I wish you every success.

AS you only need a small amount of silicon adhesive you may find it
cheaper to buy it from a hobby store where it's used for scrap booking -
make sure it says acid free and doesn't "smell"!

I don't recommend wax or "super glue" - wax makes a mess and super glue
goes everywhere and has to be chiselled off to do any re-work.

I find silicone adhesive is a bit too sticky if you have to remove it later for repairs. I use a couple of coats of nail varnish, which has enough sticking power but is easily broken away if needed, besides which you get a nice range of colours :-) A tiny bottle with its own brush lasts for ages in the workshop. Also good for locking trimmers, coil cores, trim pots etc.

Mike G8EEY.

2243. Re: New file uploaded to mkars80

Yahoo group: mkars80
Date: 2011-09-03 21:05:00 UTC
From: sa3azk
Topic: 274 Message: 2243

Here is the translated text to go with the uploaded article:

During the spring of 2011 Jemtlands Radio Amateurs, SK3JR, on 13 occasions, conducted a training and construction project with the ultimate goal to paricipate in the scandinavian portable contest May 22.

The interest for this club activity was very big and 14 club members ordered the MKARS80 kit, which is an 5W LSB transceiver for 80 m.

The kit has previously been described briefly in the swedish amaterur radio magazine QTC and is a good opportunity to learn more about how a simple transceiver is built, and an excellent source of inspiration for further experiments with amateur radio electronics.

SM3GFN Ingvar Bergström described in a educational manner all the elements of this transceiver, and how the different parts of the block diagram is built on a component level.

We also had dicussions about what tools was needed to assemble the kit with good results.

To make sure the end result would be as good as possible every one, after an introduction in solderng techniqe, performed a solderng test which was then examined and after any corrections approved.

A transceiver also requires an antenna. And this part was discussed by SM3PXO Petter Gärdin. To show the characteristics of different antenna types, the program EZNEC was used, and every participant built a relatively simple wire dipole with RG 58 C / U as feeder.

The participants had help with tuning and measurement techniques by SM3GHQ Lars Hedstrom and SA3AZK Mikael Andersson.

A website was created in the free software Moodle, where participants had access to discussions, calendar, tips, links and more. You could also ask questions and get help if you needed.

The project was so successful we feel that we need to continue with another project this fall.

2245. Almost done...Extra part?

Yahoo group: mkars80
Date: 2011-09-04 01:01:06 UTC
From: Kent Berglund PhD
Topic: 2245 Message: 2245

Good Evening,

I am on page 11 of the manual ready to install LED, and fuse, and I seem to have an extra part. When I did the inventory, I thought that I had accounted for all the parts, but here it is and I cant see that it goes anywhere and all the slots are filled as far as I can tell. It looks like a transistor with the marking CC33780 with w80 below. It has a silver face. I attached a picture of it. Anybody know what this is?

Thanks, Kent KC9LIF

Hi Kent.
It's early morning here & I can't sleep so I've being trying to imagine what it is!

Unfortunately attachments are not allowed and so the picture was removed. If you would like to send it to my personal email address at the top of this message rather than the group I will have a look. Steve will recognise the markings immediately I'm sure but perhaps I will be able to help in the short term.

The only thing I can imagine with that description is Q1 the IRF510 PA transistor but that was fitted on page 10 unless you left it out to measure against the case? How many leads does it have?

Please contact me if you haven't sorted it out yet. Persevere it's a really great kit.

73,
John G4GCL

Kent,

This should be a BC337-40 - I can't see from the photo exactly what's written on the device but for some reason they run the numbers into each other causing confusion.

2249. Microphone mod?

Yahoo group: mkars80
Date: 2011-09-04 17:39:25 UTC
From: kc9lif
Topic: 2249 Message: 2249

Hi Everyone,

I am just starting alignment phase. I got great audio the first time I plugged it in. I have a cheap microphone that I use for other project. So I don't have to cut off jack-plug, I wanted to make a box with a Stereo jack input, a PTT push-button switch, and another stereo jack output. I am a little unsure of how to hook this up. I am assuming to connect the input jack Plug tip to the output jack Plug tip. Then the output jack middle contact to PTT switch. Then the input jack Middle contact and the PTT switch ground to the output jack outer contact. This assumes that in the microphone plug the middle contact is microphone- and can be grounded? That way I have a nice PTT box that I can interchange microphones with.

Thanks, Kent KC9LIF

Kent,

I'm glad its all working for you so far..... remember to set the BFO frequency and set the PA bias etc.

Re the microphone all sounds good except perhaps connecting the input middle contact to ground, you may find your microphone is connected to both middle contact and tip so connecting the middle to ground may short it out. Suggest you make no connection to the input socket middle contact.

OK, Will proceed with setting BFO and PA bias. One step at a time. Just wanted some input on my mike mod when I got to that point, will proceed as you suggest and leave mike input middle unconnected. Thanks again.

2252. Almost there...?

Yahoo group: mkars80
Date: 2011-09-05 22:06:04 UTC
From: kc9lif
Topic: 2252 Message: 2252

Hi Everyone,

I think I am almost there. I have it in the box. I wanted to get some feedback on a couple of things.
1) When adjusting R2, I press PTT and get 250ma. When I was raising to increase 50ma+/-5ma, when I got close to 300ma it jumped up to 340 to 350 and higher, when I stopped not to overdrive Q1. I backed off and pressed PTT and it was 280s, and when I raised it past 290 it would jump around and go to 340 or higher. It was super sensitive. Just wanted to know if that others had experienced that or is this a problem?

2)In adjusting R59 and C103...When I press PTT with the Mike, or stereo jack with all leads shorted, I am not getting a small reading on the wattmeter (30w FS) to be reduced. When I put the output on the scope, it is about 200 or so milivolts. What should I be seeing there?

Now that I have Q1 heatsinked, I will repeat these tests if needed.

3)On the MKARS80 page of Radio-Kits website There is a picture of the front panel with diamond80, which is different from the panel overlay that I found. Is that available anywhere? Anybody tried using a decal? Just wanted to know.

I really like this kit and I know the radio is receiving great. Looking for an opportunity to see how she Tx's. Thanks.

The adjustment is sensitive - have you set the BFO for 10MHz? If not the BFO oscilator leaking through the filter can cause problems causing this type of symptom.
>
> 2)In adjusting R59 and C103...When I press PTT with the Mike, or stereo jack with all leads shorted, I am not getting a small reading on the wattmeter (30w FS) to be reduced. When I put the output on the scope, it is about 200 or so milivolts. What should I be seeing there?
Its normal to get it down lower than this, perhaps 40mV or less. These controls are interactive though - again if the BFO isn't adjusted correctly you may get a higher reading.

The overlay you are referring to was drawn by John M0TIF, its our club badge - why not try making your own front panel its quite easy with one of the paint programs.

2254. RE: [mkars80] Almost there...?

Yahoo group: mkars80
Date: 2011-09-07 17:39:27 UTC
From: Kent Berglund PhD
Topic: 2252 Message: 2254

Ok Steve,

1) I did set the BFO to 10Mhz and I just checked it again and it was 10Mhz.
2) I also went back and adjusted R59 and C103 and got that down to 50mv p-p. That seems to be the minimum. I just tuned it up to a frequency that I use quite frequently and it seems to be holding steady. It still was a litte touchy getting there. I don't no if that is a warming up problem or not. It will take some time to tell that. But, I think, that the drifting problem I was experiencing seems to be gone. After about 5-10 minutes it drifted or moved to 720 hz. The fine tune doesn't seem to change the frequency smoothly, sometimes, moving knob with no corresponding increase or decrease in frequency, and it jumps back 20 hertz when I take my finger off the control. I will have to watch to see what happens. Any ideas what might be causing that?

Anyway Yeah!! I am loving this radio!!

3) Sorry, I forgot that was the club logo. I was a member for a couple of years, but let my membership laps. That is a great idea. I have Office 2010, Paint, a scanner, and a lot of imagination. This little beauty deserves an image all of it is own. I will up load what I come up with.

Again Steve, thanks for have a lot of patience with this old yank. It is greatly appreciated.

2255. MKARS 80 Talk by Steve GALU at Verulam ARC (St Albans)

Yahoo group: mkars80
Date: 2011-09-16 14:13:11 UTC
From: Mick-M0MMI
Topic: 2255 Message: 2255

Hello MKARS 80 Group,

If you live in the UK and not too far from St Albans Hertfordsire, you are invited to Verulam Amature Radio Clubs next Club Meeting on Tuesday 20th September (19.30 for 20.00 start)where we are delighted to have Steve Dury G6ALU as our guest speaker. Steve will be talking about the MKARS 80 5W SSB Transceiver, the Digaital SWR Meter plus other kits and projects (http://www.radio-kits.co.uk/) We are all very much looking forward to hearing about Steve's latest project an SDR HF multi band receiver/panadapter which we hope will be available soon.

So, if you want to find out more about Radio-Kits come along to our Club Night, directions here http://www.radioclubs.net/verulam/contact.php click on EVENTS for a map for Aboyne Lodge School, Etna Road St Albans. AL3 5NJ. We look forward to seeing you.

73 Mick-M0MMI

From: mailer4096
Topic: 2258 Message: 2258

I am looking for a low cost used cw transceiver.

Ideally something cheap and cheerful.

HF or 2 M

I am in Central London.

Regards.

You might want to look the MFJ 9400 series with the CW adapter. Ten tec also has some nice QRP CW xcvrs. 73 Mike KF6KXG

2260. 500Khz off Frequency

Yahoo group: mkars80
Date: 2011-10-01 12:17:53 UTC
From: g3zdr
Topic: 2260 Message: 2260

Hello all!! my 80 is operational and rxing BUT 4000Khz is the lowest I can set the freq and it rises to 4500Khz despite settings of C38 the tuning caps and the trimmers.

What sets the freq? Have I wound the coil next to C38 wrong (not enough turns?) or something else?

Any suggestions welcome,

Paul VK3IH / G3ZDR

Evening Paul,

Your VFO is running too low in frequency - the VFO frequency can be calculated from IF (10MHz) - signal frequency.

Some one has had this before but I can't remember the cause - try and count the number of turns on the inductor then check all the capcitors are in the correct places.

Some times you can break a PCB pad from the adjoining track, it might be worth checking continuity between all tracks in the VFO. There is a plot of the track side print in the files section http://uk.groups.yahoo.com/group/mkars80/files/ called MKARS 80.pdf <http://f1.grp.yahoofs.com/v1/QHGHTnCYkcj5BDoKUrjw4IPkvs-SuMPrl3tG6k7ujcdYdbVBGke9V2rSEBtb_fybg7CuGEP9gkadN7OXTNPYUw/MKARS%2080.pdf>
.

Let us know how you get on.

Regards,
Steve G6ALU

2265. Rig progressing well :)

Yahoo group: mkars80
Date: 2011-10-04 20:38:10 UTC
From: Colin
Topic: 2265 Message: 2265

Hi all,

My name is Colin, and my call sign is M0CGH. I started building kits before I was licensed in 1997. My first transceiver kit was a Walford's Sparkford, 1.5W CW rig, which I bought to celebrate gaining my class A licence in 1999. Since then I have built many CW rigs, including some homebrew ones.

I have had quite a few comments at my radio club as to why I'd never built a 'phone' rig. I decided it was time to shut them up, so I ordered the MKARS 80 last month.

My MKARS 80 package arrived about 3 weeks ago, I have been steadily building it since then. I have powered up the rig for it's initial 'smoke test' this evening and I'm glad to say that all seems to be well and I've even received some German broadcast stations using a random length of wire strung across the room.

I'm now going to get started with the 'metal bashing'.

Hopefully within the next week or so I'll have the rig more or less finished. I want to paint the case black, so I'll have to wait for some decent weather to do the spraying outside.

I think the quality of the kit is superb, everything has gone together so well.

Well done Steve, I think you have done an amazing job!

The new SDR looks very tasty too!

Well done Colin....
Love mine to bits, a fantastic little rig...
Recently added the CW kit and the power/sdr kit to mine
and it's made a "proper" little complete 80M station..

Enjoy

Regards
Philip G4JVF

2267. ebay sales

Yahoo group: mkars80
Date: 2011-10-09 19:22:50 UTC
From: Steve Drury
Topic: 2267 Message: 2267

Its inevitable that with so many MKARS80 sold there will be the
occasional one appear on ebay, the latest is here, cut and paste all the
link into your web browser or search ebay for item 190585804694:

http://rover.ebay.com/rover/0/e11021.m45.l1123/7?euid=11137985ca28465abb7e8bffae7f6f24&loc
=http%3A%2F%2Fcgi.ebay.co.uk%2Fws%2FeBayISAPI.dll%3FViewItem%26item%3D190585804694%26ssPag
eName%3DADME%3AB%3ASS%3AGB%3A1123

It looks good but I don't have first hand knowledge of it, would
probably be good for the person who doesn't want to or can't construct
the radio.

2270. Rig now up and working!

Yahoo group: mkars80
Date: 2011-10-09 22:34:46 UTC
From: g3zdr
Topic: 2270 Message: 2270

after a few weeks of 'stealing time' from busy life the rig is up and running. I put a call into the 'bottleshop' net (valve enthusiasts) on Friday night and 20 plus stations across southern Australia in VK3 VK5 VK7 gave 5/9 plus reports.

Now to install it in an old Yaesu VFO box I set aside for the job. I have another kit that I will build up and put in the MKARS box.

I have built other TCVR projects from gather all the bits to kits, this one is very nicely designed and easy to build.

2271. Rig alignment

Yahoo group: mkars80
Date: 2011-10-12 17:32:08 UTC
From: Colin
Topic: 2271 Message: 2271

Today I began the twiddling. My radio was consuming 243 mA at first with R2 fully anti-clockwise. I managed to adjust this to 293mA ok.

The 10MHz BFO seemed to be pretty much spot on and steady when sniffed by a Spectrum Analyser at my work.

I seem to be struggling to understand the alignment of the mixer. What setting of R59 is correct? As I wound the pot down, the signal seen on the oscilloscope kept reducing until at one point, the signal would reduce no more. Is the idea to take the pot down until minimum level is seen and then leave it at that setting, or is it ok to twiddle some more? A quick tweak of C103 brought the level of signal at the BNC down to 68mV, this is the best I could achieve. I'm a bit worried about the setting of R59 though.

A quick play with a few words into the microphone seemed to put out the modulation LED quite quickly, what is the best way to ensure the modulation is ok? Is it a case of listening to the TX audio on another rig? If the microphone is overdriving the rig what do I do about it (apart from not talking as loud!)?

My target was to get my rig finished for 13th October because I am displaying my collection of home built radios at my local club, I want the MKARS80 to take it's place in the centre of the display. I'm quite pleased to see that my goal has almost been reached :)

Evening Colin,

All seems to be good - you will find the optimum setting of R59 and C103 are interdependent, after adjusting one repeat the adjustment of the other until you get the carrier as low as possible; I suspect you are near to this level now.

Just talk so the LED flickers off, I doubt that anyone will complain about your intermodulation! You can listen to yourself on another rig but make sure you use headphones or you will get feedback, you could record yourself and criticise the audio on playback.

You are right in your suggestion to cure over-driving, don't speak so loud or if its a serious problem adjust the microphone amplifier gain - I will look up the appropriate resistor if you need it.

Have fun,
Steve G6ALU

2273. Re: Rig alignment

Yahoo group: mkars80
Date: 2011-10-12 21:32:39 UTC
From: Colin
Topic: 2271 Message: 2273

Thanks for the encouragement Steve.

I've had a good search through this group and I've come to the conclusion that I hadn't just got the BFO exactly right. I tried to measure the BFO on a 20MHz Oscilloscope at work this morning, the machine didn't seem very good and the reading was a bit jumpy. My colleague then invited me to measure the BFO on a Spectrum Analyser. We probed the test point through a coupling capacitor and a nice spike at 10MHz showed on the display, I suggested some fine tuning but my colleague was pretty happy that the signal was at 10MHz.

I'm going to have another go tomorrow at work at optimising the BFO and mixer.

I have a 2 Watt FSD power/SWR meter and the meter doesn't move a bit until you speak into the mike, so the carrier is very small. I used my FT817 to listen to the carrier whilst transmitting into a dummy load and I couldn't even detect the carrier! I did record myself coming out of the FT817 and the audio sounds good to me and compares well to other recordings I've made of SSB transmissions.

The rig is fantastic and I'm really looking forward to my first QSO with it.

I'm gonna say it again, I can't fault anything about the rig - the quality is superb, in fact in my opinion, the circuit board in my example looks every bit as good, if not better, than a commercial radio. Everything worked as it should, first time.

Great kit Steve!

Thanks and 73

Thanks for the compliments Colin,

I would suggest you check the BFO frequency with another instrument - a spectrum analyser isn't the best piece of equipment for measuring frequency accurately.

I've cracked it!

I used an RF probe and my DMM to measure the RF whilst adjusting R59 and c103. I managed to get the reading down to 0V. At this point I knew I must be getting close.

This morning I fired up the oscilloscope again and I found that I could reduce the carrier to about 10mV p-p. I'm well happy with this. It would seem that yesterday i didn't have the BFO set right.

I consider my radio finished now! :)

Hopefully I'll get to try for a QSO this evening.

Thanks for everything you've done Steve.

A nice freebee but worth being aware that this is a nearly 600Mb download and it's also all in french.

From: Greg McGann
Topic: 2279 Message: 2279

'Measure between supply positive and ground with a multi-meter on Ohms range to ensure there is not a short circuit, typical values will fall in
the range 1k6 to 2k0. Note that if you reverse connect the meter IE red lead to ground and black lead to positive the reverse protection diode resistance will be measured.'

What value should the reverse protection diode be? It's the same value as the other way round... (1.97 k)

Greg

It's just that both values are identical at that measured value, both ways round. It just looks really suspicious!
I had to use quite a lot of heat on d3, (massive pad on the ground connection especially).
Anyhow wouldn't the voltage on a dmm be too low to overcome the forward bias voltage (on voltage) for the diode? Or perhaps I've been overcome by the effects of the lead solder I'm so partial to using!
Perhaps someone out there could dig out their dmm to put me more at ease...

Hi!
My Mkars80 has now good funktion.
I have wound a new T4 andT6 mixer and now I have a very good reciever.
When I send they say there are some hum. Wen I send from Batteri Acumulator they can not hear any Hum.
I must do anything and build a better Power supply
I must have 2A or 3A without any Hum.
Do you have any chema skits for a good power supply.
My transmitter give about 6W out in a Dipol.(2x 19,26m) No balun.
Were can I trim the freqvens a little?A cuppel of hundred Hz
SA7BMZ in the middel of Öland Sweden.
Hans.

Hi Greg.
I have measured my working MKARS80 with the following results:-

Red lead to centre pin of power socket +ve ---> 1.945Kohm
Black lead to centre pin of power socket +ve ---> 1.932Kohm

Diode range:-

Red lead to centre pin of power socket +ve ---> 610 Millivolts
Black lead to centre pin of power socket +ve ---> 472 Millivolts

Both resistance readings taken after stabilisation of meter due to caps
charging. Meter is a Hioki 3804-50

I hope that's of some use.

Regards,
John G4GCL

Hello Hans,
Trim the frequency with preset C83, this also adjusts the BFO frequency.

I don't have any circuits for power supplies - I use my MKARS80 from a
battery as its often used portable. Try a Google search for the power
supply, you need at least 1.2Amps, would suggest building one for 1.5 Amps +

2287. First Power up ?low current

Yahoo group: mkars80
Date: 2011-11-09 15:16:10 UTC
From: simonmcgraw@btinternet.com
Topic: 2287 Message: 2287

Hi, I have finally got to complete my rig and started the initial test.Everything has been fine up to setting R2PA bias current. My base reading is 120mA (rather than around 230mA)going to 260mA with R2 fully anticlockwise on pushing the PTT.

I am unsure where to look next and would appreciate any advice.

Thank you for your help

Simon

Hi Simon.
I'm sure Steve will jump in here as soon as he reads your message but just to clarify things are you saying that with the PTT closed, no sound if the microphone is connected, and R2 fully anticlockwise the current is 260mA or 120mA?

At 260mA it seems slightly high but in my limited opinion not too much. If, with the PTT closed, you turn R2 *slightly* clockwise does the current increase? Don't keep it in transmit for more than a few seconds without a heatsink.
I found the best way to make sure there was no external sound affecting it was to make the shorting plug as described for the PTT.

I'm sure by the time you have clarified that Steve will be here with plenty of ideas!

John.

Sorry Simon I just saw the header "low current" forgive my incompetence;-)

Try increasing R2 slightly and look for an increase as I suggested.

John.

Simon,

Assuming you are using a 12 - 14V power supply the base current (current with PTT pressed and R2 fully anti-clockwise) is too low. Check out the circuit around Q5 - note that this transistor will get quite warm / hot during operation.

If you have fitted the transistor the wrong way round (been done before!) let me know as its best to fit a replacement.

From: Simon McGraw
Topic: 2287 Message: 2291

Hi John

Thank you for your feedback.

The instructions suggest a 50mA increase when the PTT is pressed, the lowest
I can get is a 140mA increase, going higher still as I rotate R2 clockwise.

I was wondering if the receive current was too low, and where I should go
looking for a problem

Simon

From: Simon McGraw
Topic: 2287 Message: 2292

Thanks Steve, I will look at this tonight. Fitting the transistor the wrong way round is well within my capabilities!

Subject: Re: [mkars80] First Power up ?low current

Simon,

Assuming you are using a 12 - 14V power supply the base current (current with PTT pressed and R2 fully anti-clockwise) is too low. Check out the circuit around Q5 - note that this transistor will get quite warm / hot during operation.

If you have fitted the transistor the wrong way round (been done before!) let me know as its best to fit a replacement.

From: mmeerman
Topic: 2287 Message: 2293

Hi,

I seem to have the same issue here.
Just finished building the kit and reception is already great! The whole of europe on a piece of wire of about 5m hanging out of the window. The RX current is about 100mA, less than half what the instructions suggest. Using a dummyload, I adjusted R2 to minimum increase while transmitting, but cannot get it below 110mA increase, with R2 fully anti-clockwise (ie. to 210mA). Tried with a disconnected microphone, but it makes no difference.
Turning R2 only makes it higher. Input voltage is 11.7V, according to the digital display, and it stays like that during TX.
Apart from adjusting the frequency offset, and R2, I have not tuned anything else yet, but on TX I can hear myself talking on a nearby radio tuned to 80m SSB.
How critical is this initial current and increase?

2294. Re: [mkars80] Re: First Power up ?low current

Yahoo group: mkars80
Date: 2011-11-14 11:34:46 UTC
From: steve@radio-kits.co.uk
Topic: 2287 Message: 2294

Hi Michael,
I think you are getting confused with regrad the adjustment procedure.

An extract from the manual:

"press the PTT and note the current drawn. Adjust R2 for an increase of
50 ± 5mA. For
example, before adjustment (R2 fully anti-clockwise) the current was
230mA, in this example when correctly adjusted the current will be
275 – 285mA. Note as the components warm up that the current will
rise – do not transmit for more than a few seconds if Q1 isn't fitted
with a heatsink or it will overheat."

So start with R2 fully anti-clockwise, press the PTT and measure the
current - with a 11.7V supply this may only be 210mA. Whilst still
pressing the PTT adjust R2 CAREFULLY until the current rises by 50mA.

Note these measurements are taken in transmit mode with the PTT pressed
and don't relate to recieve current.

Let us know how you get on.

2295. RE: [mkars80] Re: First Power up ?low current

Yahoo group: mkars80
Date: 2011-11-14 12:02:44 UTC
From: Simon McGraw
Topic: 2287 Message: 2295

Hi Steve

I think I have misunderstood this part of the manual too.

I checked Q5 as you suggested and around it but was unable to find anything wrong.

I also thought the base level was a receive current, not the transmit current which is increased by moving R2

I understand the setup better now, thank you

Simon

Steve,

thanks for the clarification, I wouldn't have guessed that.
Yes, that is now correct. It pointed to a bad soldering point on R2 as well, so that is now fixed. After that I was able to increase the TX current from 210 to 265/270 mA, which I think is what it should be.

many thanks

Michael MoMPM

2297. R2 PA bias current setting and feedback

Yahoo group: mkars80
Date: 2011-11-18 17:29:46 UTC
From: Greg McGann
Topic: 2297 Message: 2297

I'm experiencing unusual effects which are being caused by the PA bias adjustment. I set the thing up like the manual describes:
i.e. press ptt and measure current drawn with r2 fully anticlockwise, then turn r2 until I get 50mA more with ptt still depressed.
Trouble is, it seems ok when I first set it but then get an intermittent fault where I get feedback on transmit...
(ptt is pressed and about 1 watt of rf is measured on the meter with no sound on the mic)

The trouble clears up when I back off r2 a bit again, but then the setting is incorrect as per the instructions... Does this matter?

I've been using the rig to make a few contacts, ssb is very difficult as expected. Thought I might try psk31 and had good success making a few QSOs. I kept the transmit drive level to just under 2 watts, but the board still got a bit warm.

Oh well, any thoughts would be appreciated.

Cheers
Greg

2298. Re: [mkars80] R2 PA bias current setting and feedback

Yahoo group: mkars80
Date: 2011-11-18 17:57:19 UTC
From: Steve Drury
Topic: 2297 Message: 2298

Greg,
Have you set up the BFO frequency? Its best to set up with a frequency counter to get it accurate but careful adjustment for the correct display frequency is also acceptable; adjusting for best received audio doesn't work.

Some questions to help diagnose further:

1. Is the VSWR reasonable? Certainly less than 3:1 is OK.
2. Is the microphone lead screened? With poor VSWR and a poorly screened microphone lead instability can be expected.
3. Is the kit fitted to a standard case?

Its best to keep the bias as recommended to have reasonable linearity.

Please answer the questions and I will try to help further.

Regards,
Steve G6ALU

From: Greg McGann
Topic: 2297 Message: 2299

Hi Steve,
Thanks for the quick reply, I think it's probably the BFO setup. I had a go at what I thought the manual described but I must've botched it.
SWR is fine and rig is in standard case supplied.
I haven't got a frequency counter so I was having a go at the other method. I'm not sure I'm doing it right though. (I have no other radio which covers 80m either)

If all else fails, I'll have to get a frequency counter...
How would you adjust for correct display frequency?

Any suggestions?
Cheap frequency counters for sale anywhere?

Greg

Hi Greg,

Where do you live I have a frequency counter and spectrum analyser, so could help if you are not too far away.

From: Greg McGann
Topic: 2297 Message: 2301

Hello Andrew,

Live in Edinburgh, I think it may be too far judging from your callsign... thanks anyway though. I used an online receiver to hear myself on air and made some adjustments, this seems to have done the trick. I also found a few stations on known frequencies and tried using the other method it described.
Results have been very good! I've got a 58 and a 59 from 2 stations in Belgium. One was even QRP to QRP so I'm especially chuffed! Using a full half wavelength wire up about 6 or 7 metres. I've had 60 quid's worth of fun already!
The problem has cleared up since Steve told me to check the bfo again.

Greg,

As another project you could build this:
http://www.radio-kits.co.uk/LCD_Demo/ I don't do a programmed PIC any
more but can sell you a low cost display if interested. You would need
to make / buy a PIC programmer.

Hi.
If you are interested in Steve's offer Greg I could program the PIC for
you if you don't have the facilities.
I don't have any of that type but they are available quite easily.

Regards,
John.

I've asked Santa for a posh new multimeter that does some incredible stuff, does inductance, capacitance, it's a frequency counter too! Thanks for the recommendations and kind offers though.

Greg

I have my rig working nicely, however when placing the display on the front of my large box with ribbon cable a broke a single cable loose when it was operating. I reconnected but now the voltmeter reads 7.3 Volts with 13.8 Volts connected.

Have I 'blown up' the IC voltmeter? any ideas gratefully received

Hello Paul,

The display doesn't measure the voltage, that's the job of the PIC.

Check the values of R23 and R21, if they are correct check the voltage
at Pin 17 of the micro, it should be about 3.7V. If the reading is
correct I can send you a new micro.

Regards,
Steve G6ALU

2310. Handicapped Ham need Help with Varicap Tuning Mod

Yahoo group: mkars80
Date: 2011-12-16 21:15:41 UTC
From: ad6ka
Topic: 2310 Message: 2310

I unfortunately suffered a mild/moderate stroke in late March
which makes soldering very difficult. There are some things
I can do and things I cannot do. I am more than willing to
pay an MKARS Group member good money to perform the ten turn
pot varicap tuning mod. No enclosure work required.
I reside on the West Coast of the US but am willing to ship
to/from the UK.

Of course I will supply all the parts and pay shipping both ways. If someone is willing to take on this job I would be
eternally grateful.
I don't **necesarily** need the "Four Band Section Mod"
as this seems fairly complicated.
Whatever your ability allows you to accomplish is fine with me.

You needn't concern yourself with stuffing the completed unit into an enclosure. I have a retied machinist neighbor with a small machine shop in his garage who is willing to dril, cut and tap any enclosure for me. The the stock enclosure will not fit and besides I would prefer a larger enclosure for my shakey hands.

Perhaps whoever wires the mod could make the leads to the pot and
and band switch (IF INCLUDED) included) maybe 3-4 inches long and
my friend and I could trim to fit the alternate enclosure on final assembly.

Thank you so much for your considering this,
and I wish all a safe and healthy Holiday Season.

Hi Ken!
I can do it for you.
I have alread built 4 "regular" MKARS80 and Steve knows me in person.
It will cost you no more than the cost of the components and a rig round trip to London UK!
I am not going to charge you for the labour. It is a matter of principle.
Just leave a message if you don't have a better P&P deal. It is costly to sent staff to UK and EU in general.

2312. Re: [mkars80] Re: Handicapped Ham need Help with Varicap Tuning Mod

Yahoo group: mkars80
Date: 2011-12-18 16:51:59 UTC
From: Ken Pendarvis
Topic: 2310 Message: 2312

Dear Panagiotis:

Thank you SO MUCH for your offer to build
this MKARS mod for me. This is in the true ham spirit
and I appreciate more than words can tell. I used to be
pretty good with soldering iron before my stroke and since then it
has been extremely frustrating not being able to do the simplest of tasks.

One question I have:
There are 2 or 3 different MKARS varicap tuning mods posted
on the Net. Which one are you planning to do, so I know which
parts to ship? I really only need the "simple mod" (No 'band segment
switches') and besides, that will make it simpler for you.
I am thinking that the "simple" (No switches) mod from the PA0RCL
Web Site (see attached file) would work well and be the least amount
of work for you. But whatever mod you feel most comfortable doing, please
let me know so I can get all the parts, OK? The MVAM109 Varicap is not
available in the USA, so I will have to substitute the NTE 618. I have read
that this will work but am not sure. All of the other parts are of course
standard parts, and I have read one should use shielded wire (center
conductor
of RG-174 or RG-316) for the lead to the ten turn pot. I have some of this
I can send.

Panagiotis, my machinist neighbor is going to help me mount the MKARS
into a larger enclosure. So I need the tuning pot to have a little extra
wire,
say 12cm or so. Will this negatively effect the tuning of the MKARS? If it
wont
work I will not do it. would "Remoting" (MOUNTING OFF OF THE pc BOARD)
the GAIN and RIT controls have a negative effect on rig performance?
(Don't worry, my friend would do this work for me, I would just ask
you to please make longer wires to controls if possible. If not
possible,forget
it I do not want to take advantage of your generosity my friend!!)

Is your address good at QRZ.com under SV3AUW?
What is the best way to ship the unit and parts to you?
Post? Registered Post? DHL?(VERY Expensive) I am thinking
Registered Post would be good.
A problem is that I do not have a Pay Pal account, so how
would I pay you return postage? And how much would I know
how much it costs from your QTH? Could you send me an email with
the Registered Post Return Charges and I could send you cash via registered
post, maybe hidden in a book or magazine? Let me know what you think.

By the way, I have an unbuilt MKARS CW Adaptor Kit sitting here and
I have no use for it now. I would like to include it as a gift for you for
doing this very kind modification for me. If you already have one, you can
sell it
and use the money to buy something else, hihi.

OH, I also attached a WORD file of the parts I think I need to send you
for this mod. Please make any changes you thinkneeded nd I will get the
parts ASAP.

Thanks again for your generosity in the true
spirit of ham radio.

Hello Ken,
A ten turn pot should give better bandspread than the variable capacitor in the kit but it will be very non linear bandspread. Personally I find the Cap' supplied adequate but anyone doing the varicap mod' might be interested in a circuit that gives near enough linear tuning with a varicap. It was published in Sprat, the magazine of the GQRP club. Issue 133, winter 2007/8 . The article was written by Bob, K3NHI, and titled " Linearization of a varactor tuned VFO".

HI Ken:

Thanks for you helpful and informative message.
I am over here in the old colonies and am unfamiliar
with that publication (Sprat),Could you please be so kind
as to email an address where I might write to the publisher
for back issues?

I was playing with the MKARS just tonight. Even with my fumbling,
it is not awful to tune sans mod, but any mod would be an improvement,
even if it not perfectly linear. I AM very interested in how they do it though.
Thanks agn for the heads up, Ken AD6KA, ex 5R8GQ

2321. Second batch of printed circuit board holder kits

Yahoo group: mkars80
Date: 2011-12-25 21:50:15 UTC
From: Ken
Topic: 2321 Message: 2321

On to the second batch of board holders kits... I came up with this after I got tired of chasing around pcb's on the bench top during construction and testing. I have one of those gimbaled pcb vises, but it takes up too much room on the bench.

This is perfect for secure holding of PCB's during soldering, prototyping, and testing. A dovetail groove prevents any slipping of the board from the fixture, with minimal clamping pressure. The jaw opening will easily accommodate and securely hold boards from 1/4" to 5", easily extended with longer rods. The jaws are fabricated from UHMW, (ultra-high-molecular-weight polyethylene), rods are Nylon. Easily replaceable elastic band for many years of service.

All the details are here for anyone wanting to build one, or there is a complete kit of machined parts ready for assembly.

Hi ,

I recently completed my MKARS80 and decided to try it out in the IRTS 80m Irish counties contest last Monday . Using a 1/4 wave wire I made 24 contacts across Ireland and the UK over the course of about two hours - not bad for only about 4w output and a simple wire antenna.

Thanks for a very well designed kit Steve !

2324. My first contact outside of the EU with MKARS80

Yahoo group: mkars80
Date: 2012-01-05 19:10:53 UTC
From: woodiescbj
Topic: 2324 Message: 2324

Hi all, it has finally happend, I have had my very first contact as a QRPer outside of the EU and that with the MKARS80, due to a very small garden I have not been able to put up a decent antenna for 80m, untill I came across the KC8AOH Tactical Delta Loop.

(http://www.angelfire.com/electronic2/qrp/tacdelt.html)

Its a full size G5RV but only takes up 1/3 of the space, it fits in my garden as a horizontal "V" about 8m off the ground, I didn't hold out much hope of the ant working but to my amazment I had a contact with VY2/K6AAX Pat on Prince Edward Island, Canada. you can imagine the pile-up he was causing, it took me over 1 hour of calling him but I made it on 27/12/2011 at 06:48 UTC he gave me a 5/7 report and he was 5/9+10dB with me in Bonn, this is something I have been waiting for about 10 years so I am a happy chappy.

2325. Blown IC4 regulator?

Yahoo group: mkars80
Date: 2012-01-07 19:58:53 UTC
From: Andy2612
Topic: 2325 Message: 2325

Hi there.

This is my first attempt at building anything this complex, so please be gentle!

My repeated inspection of the board failed to notice that I'd inadvertently placed IC4 backwards, a fact that I only discovered when trying to work out why there was no voltage on the +8V test point.

I was able to remove and re-fit IC4, but on power up the board fuse blew instantly. Does this mean I've damaged the regulator and need to replace it, or should I be looking for some other problem on the board before going any further?

Any suggestions to aid further troubleshooting?

Andy M0HAK

2326. Re: [mkars80] Blown IC4 regulator?

Yahoo group: mkars80
Date: 2012-01-07 22:47:54 UTC
From: Steve Drury
Topic: 2325 Message: 2326

Hi Andy,

First remove the regulator as it will be faulty then check with a
multimeter between + and - for a short circuit. On a couple of occasions
we have had the washers on the RF gain and fine tune pots slip across
tracks and cause short circuits so if this is the case loosen the nuts
and push the washers away before re-tightening the nuts..

Let me know the result and send me your address by private email to
steve"at"radio-kits.co.uk and I will send you the required components to
get yourself going.

Regards,
Steve G6ALU

2327. Hunter SDR Receiver

Yahoo group: mkars80
Date: 2012-01-10 22:18:19 UTC
From: Andrew
Topic: 2325 Message: 2327

Dear Steve

I have built the Hunter SDR receiver, and it works fine, I know this is the MKARS 80 group, however, are there any plans to build an SDR transmitter?

Hello Andrew,

I have an SDR transmitter running but there are significant problems with spurious emissions dependent on what sound card you use. You have probably noticed that Power-SDR (from Flex radio) is set up to use just a few sound cards, these are no doubt the ones that Flex radio have found suitable.

The other problem I noticed is poor performance due to the latency of the sound card / PC software - CW would be very hard to use unless you have a local side-tone (like the Genesis) driven directly by the key / paddle.

A built in CODEC would get round both these problems but that would require programming ability (for USB) beyond mine.

Steve

2329. Well chuffed

Yahoo group: mkars80
Date: 2012-01-14 16:22:16 UTC
From: Naqoyqatsi (aka the ICM)
Topic: 2329 Message: 2329

This week I finally boxed up my MKARS80 transceiver that I built about 2 years ago but had never tested on air.

I have just connected it up to a 40 foot 'long' wire which is so close to the ground (less than 5 foot at the highest point) that it must act as an NVIS antenna.

I heard GW4BLE calling CQ, called him and he came straight back at 59 both ways.
I am more than chuffed considering the rig is only running about 5W PEP and I hadn't even tuned up the antenna!!!!

Steve you designed a cracking little bit of kit!

I've just ordered the CW adaptor and hope that it takes me less than 2 years to get that running!

Mind you the other project on the bench at the moment is an MKARS80 I got off of ebay for silly money that's showed large signs of 'interesting' soldering but it's working again now and waiting casing up.

All the best

2331. Display Assembly - Page 12 of Instructions

Yahoo group: mkars80
Date: 2012-01-14 19:37:35 UTC
From: Frank
Topic: 2331 Message: 2331

Can anyone elaborate on the display connection? What size wire is used? Also there are 16 connection points on the LCD but only 10 connections on the socket strip. Does alignment matter? Any help is appreciated. Thanks so much.

Hello Frank.
It's a while since I finished mine but I will try to help.

First of all make sure that you are using version 1.2 or later of the instructions because in V1.1 it didn't mention the alignment.
The official way is to mount the socket onto the non component side of the PCB and then mount the display so that the left 10 holes of the display align with the socket, then using tinned copper wire push it through the display holes and into the socket,
then making sure the display is parallel with the main PCB just solder the wires to the display board. In that way it can be removed if required.

I used a mating socket and a small piece of ribbon cable so that I could keep the display connected whilst moving it to one side for fault finding. It wasn't necessary for two reasons, 1, the radio works without the display and 2, I was lucky and didn't have any faults! ;-)

I hope that helps, please ask the group if you have any more questions.

Regards,
John.

I intended builders to use off cuts from components to make the
connections - push them through the LCD display into the socket strip
and solder to LCD display, don't use too much solder or it will travel
down the wires into the connector strip and you won't be able to
"unplug" the display if you need to service the radio.

If you don't have any off-cut leads left let me know and I can send a
piece of tinned copper wire.

I have uploaded a couple of photos here
http://uk.groups.yahoo.com/group/mkars80/photos/album/660096965/pic/list
to help.

2335. VFO doesn't start normally

Yahoo group: mkars80
Date: 2012-01-15 10:27:21 UTC
From: PH9Z@amsat.org
Topic: 2335 Message: 2335

Hi,

I'm in the testing fase of my kit. If have a couple of problems. One is that the VFO doesn't always start.
Sometimes it starts when I put a scope probe on the poly varcon and it keeps running.
But when I do a power cycle is doesn't start again...

Any pointers?

73 John PH9Z

John,

Can honestly say I haven't seen this problem before - when it starts is it on the correct frequency? Have you done a voltage check on the oscillator and buffer transistors?

What is your second problem? Just in case its related.

Please come back with the answers and we will go from there.

Hi Steve,

The frequency is Ok. The second problem is recieving at all. It only recieves every now and then. I'm supecting a solder problem somewhere. At the moment I'm reheating all the points.

John,

Not receiving intermittently is likely to be caused by poor joints on
the mixer transformer connections - best to go over them with a very hot
soldering iron to ensure all the enamel has burned off and a good
connection made.

Check the VFO voltages are OK.

Steve,

I've have resoldered everything and I think if i do any more soldering I will destroy the PCB..... As far as I can measure the mixer is connected fine. All the voltage seem to be there. I don't have a trx on 80 mtr operational so I can't "inject" any signals ;-(.

Can you (or someone else) have a look if I send it over?

John,

You may send it back (use the address on the invoice) but I may not be
able to offer a fast service, I will ask you to pay the return postage.
If you do return it please used a "signed for" service and pack it well
to protect against damage - the display need not be fitted.

If you have a "Dollar Store" nearby then you will most likely find some kind of "computer microphone" there. You could also try to get hold of one of the larger mic elements that *used *to be made by Panasonic and build up from there. That's the best I can come up with. 73, Tryg EI7CLB

Hi John!
Check if you have 12V on both sides of T3 and T1.
Enamelled wire give trouble from time to time.
Unsolder the transformers and scratch the enamel thoroughly before you solder them back again.
Usualy this is a cure of the problem!

Steve,

I've have resoldered everything and I think if i do any more soldering I will destroy the PCB..... As far as I can measure the mixer is connected fine. All the voltage seem to be there. I don't have a trx on 80 mtr operational so I can't "inject" any signals ;-(.

Can you (or someone else) have a look if I send it over?

ebay has lots of PC mics which you can pull apart and add ptt momentary(I built one into a pen), also for $10 off ebay a single plug speaker mic is suitable and looks good with the radio, just pull it open, remove the speaker (to stop possibility of coupling) and wire for simple ptt as these mics have a capacitor mic inside them.

From: Rob Lane
Topic: 2346 Message: 2346

I'v been playing with some code I was using for dual height characters on a 16x2 display.

I applied the code to a 20x2 for test purposes and I've posted a photo of the result.

Topic: 2346 Message: 2348

Yes all numbers are possible and also a slightly 'thicker' numbers version.

It uses the 8 custom character locations (0 to 7) in the LCD display to store the pieces that make up the numbers. Such as U and L (not characters but shapes) if you look closely at pic you get the idea.

A routine is used for each number to display on the LCD over two lines with same location code.

This such as:

Zero:
LCDOUT $FE,$80+position, 1
LCDOUT $FE,$C0+position, 5

One:
LCDOUT $FE,$80+position, 0
LCDOUT $FE,$C0+position, 0

Where position is a matching byte and the single digit is the custom character

I'm not an assembler coder but I use a basic compiler.

At the moment I've bought a 16f819 for more code space and written code that covers everything but with the ideas as markers.
i.e, huff n puff as a pwmout: call but not yet fully coded.

I'm concentrating on getting the frequency counter running accurately. (Timing)

I suspect you could possibly implement the idea in assembler for the 818 as it still has some room left.

Hi Rob,

I used pure PWM for Huff and Puff before but found the way I do it now
better, less noise on the VCO control volts.

Hi Steve,

Yes I liked the filter after the output. I quickly glanced at your code, how did you utilise the pwm to lock the vfo? I think I saw a small pwm and then a larger pwm controlling it, am I correct?

The filter gave me an idea on how to utilise a design I made some time back.
I have the varicap tuning mod fitted and so i made up a basic pwm drive up/down/memory tuner for it but was never able to get the required voltage swing using freq to volt conversion. Thinking now I could use the filter idea and voltage only conversion to make it work.

Right now I've stuffed the 819 chip so the big character idea is waiting for another one. I've been developing something else alongside and stupidly fitted the chip in reverse in the development board when I changed over!

We did meet a couple of times but I'm pretty anonymous, so you probably don't remember. Last time was at GQRP convention.

Rob

Steve and others - Please help, I am a liberal arts guy.

I had to purchase a new LED. Hoping this is suitable replacement which is 3mm, Red, T-1 Size, 3 Volt, 15mA, 2.5mcd. Power dissipation is 45mW and forward current is 15mA max.

Can you send photo of how you suggest wiring up the mic switch? Thanks very much.

Hi Frank.

Steve will be able to give the final word on the LED but looking at the resistor value feeding it and the zener I would say it's fine.

I've enclosed a drawing I just did of the plug wiring but I doubt that it will come through to the group so a copy has been sent direct.

I hope that's what you wanted.

Regards,
John.

Frank, are you OK with Johns diagram?

The LED should be OK if it lights, you won't cause any harm.

Topic: 2352 Message: 2355

Hi Steve.

Following the diagram this morning I sent Frank a picture and
description of the little box containing the PTT switch I made.
It's just got a couple of stereo socket wired together and the switch
shorts the 2 points when pressed, I did that so I could easily change
the microphone and I have a few of the audio leads with stereo plugs
fitted to go between the box & the radio kicking around.

Hope you are keeping well.

All the best,
John.

Hello Simon,

You really need to have the BFO correct at 10.000MHz, first check the capacitors around the oscillator are the correct value. If all looks OK I will send you another crystal and trimmer, I've not had this problem before though.

Regards,
Steve G6ALU

Frank,
I didn't see Johns sketch so here are my instructions!

The PTT is wired between the stereo jack outer connection and sleeve contact, the microphone is wired with the screen wire to the jack outer connection with the centre wire connected to the jack tip.

When you speak can you hear any audio coming from the loudspeaker? If the microphone is correctly connected you will normally hear a small amount of microphone audio from the speaker.

Regards,
Steve G6ALU

Hi John,

Saw the picture (from private email) and looks nice and clear - only comment I have is that the electret microphone capsules are polarised so the ground side goes to the jack outer connection.

Steve

Thanks Steve. The mic cable is coax. I wired the center conductor to the plug tip. I then wired the braid (PTT Circuit) to middle contact and outer contact. Works great on my laptop as a test. Ideas? Thanks. Frank KD8FIP

Hi Steve.

I did mark it as +ve to the tip & -ve to the outer connection. Perhaps I should have said ground rather than -ve.

John.

Hello Frank,
The braid on the coax' lead from your mic' should only go to
the outer connection on the plug, the inner of the coax goes to
the tip connection. Your push to talk switch should have one lead
to the outer of the plug [you could take it to the braid at the mic'
end of the cable] and the other lead from the switch goes to the
connection on the plug for the band. If it still does not work, try
an ohm meter across the leads from the PTT switch to check that
there is no circuit when the switch is not pressed. I have seen some
stereo plugs that were not standard in that the band was much longer than
usual, this type of plug could short the band to ground without any other
connection. Easily tested, just plug the plug without any wires into the
socket, it should do nothing, if the set goes into transmit the plug is not
suitable.

From: ad6ka
Topic: 2342 Message: 2371

Frank:
Call me old fashioned, but I homebrewed
my MKARS mic with this electret element, a stereo
jumper using the braid as ground, and a mini N.O.
momentary button switch from Radio Shack, all in a plastic
project box from Radio Shack.

Element:
http://www.radioshack.com/product/index.jsp?productId=2062216
>>>RS Stock #270-092

Enclosure:
http://www.radioshack.com/product/index.jsp?productId=2062279
>>>RS Stock #270-1801 3"x2" x1"

"Mini" N.O.momentary Button Switch:
http://www.radioshack.com/product/index.jsp?productId=2062543
>>>RS Stock # 270-1556

I had the 1/8" stereo phono cable on hand.
They are not all made the same, sometimes the ring is too wide.

I Drilled holes for the element, switch and cable.
***For the element, drill small and widen with rat tail
file till snug. Do not use glue.****Observe Polarity!
The leads on this electret come in handy when wiring up.
A little open cell foam in project box will improve the sound.
***Use a cable tie or two on the cable
on the inside for strain relief.****
Good luck....you're almost there buddy!
73, Ken AD6KA
I can make one of these for you if you like.
Some of my friends laugh at it until they hear how good it sounds.

2372. Radio Kits SWR Bridge/PWR Meter Kit

Yahoo group: mkars80
Date: 2012-01-26 22:34:43 UTC
From: ad6ka
Topic: 2372 Message: 2372

Has anyone encorporated one of these
kits into their MKARS80 or any other
QRP Project? I bought it and it looks
very nice but have not built it yet.

I was wondering how you liked it and if you
had any tips or experiences to share.
Because of the sorta unusual(non issue)
enclosure I want to use, I will be remoting **both**
the MKARS Frequency LCD Display AND the SWR/PWR Meter
LCD display, maybe with the meter's fwd/reverse sensing
board in a mini enclsoure inside the project for
RFI purposes.

TNX ES 73, Ken AD6KA/5R8GQ

Any and all experience with the Radio Kits

Hello Frank,
Yes the braid goes to ground, so does one side of your PTT switch. The outer, or ground connection on the plug usually is far longer than the other two connections and often has fold overs at the top to clamp the cable. The tip connection is usually dead centre and the sleeve, or band, is inbetween.

Yes. The metal piece closest to the black
plastic sleeve on the phono plug is always ground,
always braid.

2377. Re: [mkars80] Radio Kits SWR Bridge/PWR Meter Kit

Yahoo group: mkars80
Date: 2012-01-26 23:04:02 UTC
From: John
Topic: 2372 Message: 2377

Hi Ken I built the kit.

The only problem I had was finding a suitable case plus the fact that whatever I wanted to build it into put the switches in an odd position. I ended up putting the LCD assembly in one box and the part with the SO239's in another.
The two are connected by a stereo lead, I always seem to have a few of those! The "sensor head" is in a die cast box and the readout has been modified so that the display lays parallel with the circuit board leaving the switches at the back.

It was a tight fit in the box I had but it all fitted and it's one with a built in battery compartment for what used to be called a PP3, I can never get my head around the new numbers!
The battery isn't really used because it's powered from the shack supply most of the time but the option is there.

Of course, as usual I can take photographs if anyone is interested!

Hope you are well Ken,
John.

Thanks for sharing your experiences with the
SWR bridge, John.
Sounds like it came out well for you.
Though physically those switches have four leads,
on the schematic it looks like they close one line each
so I can substitute and remote single pole N.O. momentary
mini button switches.
Though I can see the advantage of having the sensor
box remoted from the LCD/Control box sitting on the desk.

Subject: Re: [mkars80] Radio Kits SWR Bridge/PWR Meter Kit

Hi Ken I built the kit.

The only problem I had was finding a suitable case plus the fact that
whatever I wanted to build it into put the switches in an odd position.
I ended up putting the LCD assembly in one box and the part with the
SO239's in another.
The two are connected by a stereo lead, I always seem to have a few of
those! The "sensor head" is in a die cast box and the readout has been
modified so that the display lays parallel with the circuit board
leaving the switches at the back.

It was a tight fit in the box I had but it all fitted and it's one with
a built in battery compartment for what used to be called a PP3, I can
never get my head around the new numbers!
The battery isn't really used because it's powered from the shack supply
most of the time but the option is there.

Of course, as usual I can take photographs if anyone is interested!

Hope you are well Ken,
John.

As there looked to be no problem with the components or the board, I borrowed a friends frequency counter and I could get the BFO to 10.000Mhz, it must have been my faulty frequency counter.
I will return the unused new parts to you Steve. Sorry for the inconvenience. Simon

Hello agn. Simon !

Probably your friends counter,the one that you meassured 10MHz with.
Use your counter and do the same meassurment and than set your
counter with the adj-trimmer in your set.As i understood your
counter shows about 3 KHz wrong !
What is your callsign anyway?

Yes 1.3 is correct, use the thickest wire for the big transformer - if
you are unable to wind it with this then the 27 SWG will work.

Thank you Steve for reply soon. I hope the varnish is not damaged... there is no a "lot of place" in the core... ok for pdf.

Other thing, I think it's better to use a "demultiplication" for the VFO, I have one... (1:4)

I have pleasure to work on MKars 80 (a nice weather to do that : snow... and I am retired)

From: John
Topic: 2405 Message: 2406

Hi John.

I think a commercial microphone with an on/off switch actually
disconnects the microphone to mute it and isn't meant to control anything.

There used to be, many years ago, microphones which had a switch used
for pausing a tape recorder but they were fitted with plugs for specific
recorders and I don't think they were electrets.

It may be possible to modify the switch connections though.

Regards,
John.

Hi John.
The only problem I can really see is that perhaps on a mono microphone
they may not have used 3 core (2 + Screen) cable which would mean that
you may not have access to the 3rd pin of the plug.

I don't know if that's likely but it's possible!

Good luck,
John.

I don't know of two different types, perhaps they are different makes -
the 0.1A type should do fine.

I checked my current batch of kits and they are correct.

2414. mkars80 knob power losted

Yahoo group: mkars80
Date: 2012-02-14 17:15:00 UTC
From: F5mpw
Topic: 2414 Message: 2414

Hello Steve!
A very good thing for the Mkars 80 is a VFO with a reduce speed knob. I try and can adjust on station without tune fine...
I think I have a pb around filter quartz... because I lost power in.... (for TX)- I am not sur of my transfo T2 (perhaps short circut)...?
All the best 73 philippe F5MPW

2415. Polyvaricon values.

Yahoo group: mkars80
Date: 2012-02-14 17:34:09 UTC
From: Naqoyqatsi (aka the ICM)
Topic: 2415 Message: 2415

Hi Steve et al.

This is probably a really stupid question but I have been given and am rebuilding a very poorly built and mistreated MKARS80.

The original polyvaricon tuning cap is actually melted (due to unbelievably bad soldering by the previous owner)

I can't see the values for the part on the circuit diagram but I have some that look physically identical to the ones used in my own MKARS80s, even down to being the same make.

The parts I have in my workshop measure in at 66/152pf per section maximum capacitance.

I don't want to pull my own MKARS80s apart to measure the caps in them and don't want to fit my new one into this board without being pretty certain it's the right value as the track on the board is pretty dire from poor, over heated soldering.

So I wonder if you can tell me what the intended values are please.

Many thanks

Slim G4IPZ

Dave, sounds like a good idea!
This Sunday I'm not at home though but I made a note and will try the Sunday(s) after.
My reception is excellent, but I only made 2 qso's so far, one with a nearby station just to test and one random with marginal signals.
So thanks for the info and hope to work you, and others!

Hi Slim

I'm sure Steve will be along shortly but just out of interest the varicap mod is usually based around the MVAM109 which has a range from around 20 to about 450pf so that will give you an idea.

How about converting it to varicap tuning? Using a 10 turn pot would give a good bandspread.

All the best,
John.

From: Steve Drury
Topic: 2415 Message: 2418

Capacitance is:

Antenna capacitance 3.0 - 141.6pF
Oscillator capacitance 4.0 - 59.2pF

So yes it looks like the same type.

Regards,
Steve G6ALU

From: Naqoyqatsi (aka the ICM)
Topic: 2415 Message: 2422

Hi Steve.
Thanks for the information
As its physically identical so, allowing for component spread and meter tolerance on my measuring the values they must be the same beast.

To John, I can't really do the conversion to this rig as it's not my MKARS80. It belongs to someone who got caught by buying it at a rally off of a flea market stall I think it was. They were assured it worked and, of course it most certainly doesn't.

I have a feeling I may have made a rod for my own back in offering to look at it but we can but see. I had to clean up probably 50% of the soldering and several pieces of track have been patched already. The only good news is that the display is undamaged as I tested it on something else and it works. Surprisingly the toroids all seem well wound but I've found a couple of broken wires on the binocular bead coils that I was able to pick up and remake.

Some people just shouldn't try building kits even when the instructions are as good as those for the MKARS80.

OK, with a 12V supply the quiescent TX current consumption is normally about 300mA (250mA before bias adjustment), if you haven't done so already do a voltage check on each of the TX transistors - note that the ZTX651 will get very warm, this is correct.

Hi Andy

I think you may have adjusted R29 in error. If you turn it anti clockwise slowly it should resolve your display problem.

Thanks, Dave, but it´s not that simple...
If I turn R29 from one end to the other I can only make those blocks better visible ;-)
Just uploaded a new picture.
Checked voltage at R34 and VR2. Seems o.k.

Hi Andy

Yes I see, you only have partial display. I would certainly check the display connections thoroughly. I expect Steve will pick up on this thread soon and be able to help you more. Hope you fix it soon.

2432. CW adaptor

Yahoo group: mkars80
Date: 2012-02-15 21:20:28 UTC
From: simonmcgraw@btinternet.com
Topic: 2432 Message: 2432

Hi
I have finally got round to building my cw adaptor, I get a good side tone and noise from the straight keyer and iambic keyer to speaker but get no output to the microphone cable. I get 6v at pin1 on IC3 when producing a tone, IC2 gives 2.5v on pin1, 1.5v on pin6 and 0.5v on pin7 with about the same at the OSC test point, nothing like the 4v p-p it suggests on the wiring diagram.
Has IC2 died? do I need to check/test something else?

Thanks a lot Simon

Sounds like either the PIC or display has failed, normally happens if
you have a little accident and you short across the PCB.

Please send me your address direct to steve(at)radio-kits.co.uk
(substitute @ for (at)) and I will get a pair posted.

Before you fit the new display and PIC please check there is clearance
under the display and nothing can short out on to the display PCB, also
check the 5V is correct.

Please confirm you can hear stations through the speaker, if not it may
be that the BFO isn't running. If you have a scope please check this at
TP10MHz.

The BFO should be relatively easy to adjust but may be difficult to get
accurate to 1Hz.

Regards,
Steve G6ALU

If you have a side tone then there can't be much wrong as this comes
from the filter output.

What voltage do you get on IC2 pins 3, 5 10 and 12?

Have you double checked for solder bridges and the like?

OK, with a 12V supply the quiescent TX current consumption is normally
about 300mA (250mA before bias adjustment), if you haven't done so
already do a voltage check on each of the TX transistors - note that the
ZTX651 will get very warm, this is correct.

Regards,
Steve G6ALU

Will be posted tomorrow Andy, I don't have any with me today.

Its easiest to determine which is faulty by substitution, most often
it's the display as they are very sensitive to application of wrong
voltages.

2440. Re: LCD display shows only black squares?

Yahoo group: mkars80
Date: 2012-02-16 15:23:09 UTC
From: panzerbeeb
Topic: 2426 Message: 2440

In my experience, having met this problem before, it is worth using a test meter to check continuity between the relevant pins on the pic and the pads on the display. It only takes one dodgy connection on an address line to cause this effect. I removed the displays from some of Steve's ATV controllers to remote mount them and suffered this effect on a couple, which turned out to be due to a minute fracture between a track and its pad. All the pics and displays survived without damage.
73 Mike.

I realise I have been checking my voltages against the wrong ground plane.

I get much better readings, ie a 4v output test point on the sillyscope (in my hands) if I use the normal ground plane rather than the isolated one

I too had this problem when I first powered up my MKARS80. It proved to be the connecting wires between the LCD board had not been pushed firmly enough into the sockets when first wiring up the LCD. After redoing the link wires, the display has worked reliably

From: Steve Drury
Topic: 2426 Message: 2444

Yes I have had this several times before and it may be because the
display was disturbed...

Please check, I will send a display / micro if still no joy.

Steve G6ALU

Ahhh!

I don't think it will be the chip then! Do you get a decent sinewave at
the filter output?

2447. Finally made new microphone successfully

Yahoo group: mkars80
Date: 2012-02-16 21:06:16 UTC
From: johncronhelm
Topic: 2447 Message: 2447

When I press PTT red LED comes on as expected,but when I speak into the mike with heat sink on Q1 the Led doesn't turn off and on as expected. Where should I check for problems in the circuit? Receive is perfect. Any ideas?
Many thanks, John VO1JCC.

Topic: 2447 Message: 2448

John,

The check list I use is:

1. When you talk into the microphone can you hear your self through the loudspeaker? There is normally a small amount of microphone leakage into the audio amp.
2. When you press the PTT does the power meter "kick" very slightly, it is normal for it to do so.
3. What is the current consumption when in TX? With the bias set about 300mA is normal on a 12V supply.

There is really no substitute for voltage checks - do all the voltages concur with those in the manual?

Steve G6ALU

2451. Transmit dead!

Yahoo group: mkars80
Date: 2012-02-18 01:55:44 UTC
From: johncronhelm
Topic: 2451 Message: 2451

Hi Steve,
The microphone tests you asked me to do are all negative. I did the voltages on IC2 and it looks as if that is partially fried. pin 1 10, 11,13 read zero pin2 is 1.6.volts. Unfortunately at one stage I adjusted it in its socket when I accidentally had the power on. Would you agree that this is probably the cause?
John VO1JCC.

Topic: 2451 Message: 2452

Do you have a display?

If so IC2 is unlikely to be fried, a faulty micro can't stop the radio transmitting.

If you are a member of a radio club is there some one with good electronics knowledge you can pass the radio to for fault finding?

Steve G6ALU

Steve, the display is not yet connected,wanted to make sure transmit working first.
Is it possible to have abnormal voltages on IC2 and still have It intact? Will seek help of electronics knowledigble club member. Thanks Steve.

John,

Most of these pins are dependent on a display being connected so don't
panic!

If you can get your club "specialist" to look at it please do so, if you
want to send it back for my attention you are welcome to do so but as
I'm busy a resolution will take some weeks.

Regards,
Steve G6ALU

2456. cw adapter

Yahoo group: mkars80
Date: 2012-02-18 18:40:34 UTC
From: Graham
Topic: 2456 Message: 2456

Hi the only problem I had on finishing the adapter was there is a short length of copper on the top side of the board that links the key jack socket to point A It has holes through but no connection a short wire link fixed it .Its just behind the input sockets one end near C15.
Works a treat Graham G3UD

Hi John!
Having constructed some of Steve's excelent Kits, I would advise you to check if you have 12V (or your supplying voltage) on all ends of T1 and T3.

2465. Heat Sink

Yahoo group: mkars80
Date: 2012-02-20 02:11:24 UTC
From: johncronhelm
Topic: 2465 Message: 2465

As a temporary Heat Sink before boxing up I have used a 32nd inch Aluminium plate 1 3/4 "x 2 3/4" screwed to the back of Q1 drain. Can anyone tell me if this would be adequate for PTTand Microphone tests of transmit mode of the MKARS80. Recently I blew the fuse during PTT test. which is the reason I ask. Perhaps I have answered my own question! Any ideas?

If it runs cool (doesn't burn your finger) it's OK, but watch it doesn't
short to other parts or you will blow the fuse or worse.

Hello.
I found my error on my Mkars 80: I had somes difficulties when I wound T2, I redid it today. Only 3 turns! no 5!
Now 3 watts but I need to adjust current as written in pdf.

At this moment RX 110 ma - TX without speak 290 ma - and whistling 900ma- voltage 12w...
the Mkars is not in enclosure...
All the best! 73 Philippe F5MPW

Ok Andry,
Even few milli watts (about 300 mw) the LED extinguish... when I speak loud with my Mkars...
Now I am waiting for the real values of currents - RX - TX without speaking - and TX with a loud whistle. I have to tune in the metal enclosure, perphaps a better microphone...
MKARS 80 is a good "bargain" ;-) 73 philippe F5MPW

Typical currents at 12V supply are as follows:

Receive with no audio - 110mA
TX with no modulation - 285mA
TX with a whistle to produce ~ 5W - 1.05A

These currents will differ a little depending on device characteristic,
tolerances etc.

The most common reason for low TX output is poor soldering on the mixer
transformers T4, T5, and T6.

On two occasions I have had cracked track in the emitter decoupling
circuit of the TX stage transistors Q5 and Q9. Check the track for
continuity around C23 / R24 and C43 / R36. This will need checking with
a meter as it may look OK visually, note that with this fault the DC
voltages will be correct.

Cracks between track and pad can be caused by blunt side-cutters or
cropping more than one lead at a time which stresses the track.

2478. frequencies for U.S. ham bands

Yahoo group: mkars80
Date: 2012-02-26 19:18:56 UTC
From: kl7dave
Topic: 2478 Message: 2478

I'm just starting my build.

What are you U.S. hams doing - using this between 3.6 and 3.8 MHz? Is there an easy way to shift from the designed 3.5 - 3.8 and include 3.6 to 4.0? Is this just done during tuning, or were some mods needed?

Any details and discussion would be appreciated.

thanks,

Dave KL7P

Hi Dave!
Do the varicap mode and you will cover 3.620Mhz up to a little bit over 4Mhz.
Although it uses a multiturn pot, you have to be light-handed.
The more the band spread the more the sensitivity of the pot!
I have made two mods already. One for Region1 and one for Region2!
I wish you all the best and good DX.

Increase the value of C47 slightly - 82pF NP0 type suggested.

Topic: 2478 Message: 2482

Hello Philippe,
Is the set in a metal [screened] box ? and are the MKRRS80 and
the IC7000 well seperated ? Double side band is generated in the Tx
and USB removed by the filter but if close enough you will probably
hear the USB signal direct from the Tx, that is, not from the aerial.
You really need to examine the output on a spectrum analyser to
check USB level. There will always be a small amount of USB
radiated of course, no filter is perfect.

Topic: 2478 Message: 2483

Dave,

The final band adjustment is very easy and allows the full range.

At the moment, mine tunes from 3.490 up to 3.933. There's a trimmer on the main varicap that allows you to adjust the band. Very easy.

I got mine finished not long ago, and this weekend I had good fun with the french REF contest on 80m SSB.
Checking locators on QRZ.com, my best dx is now well over 700 km, and several over 500km. And that is 4Wtts into a inverted L antenna (end-fed).

73's and good luck

Michael M0MPM / PA3BHF

HI
I am new radioamateur and I am 75 yers old.
I have built an MKARS80 an it will funktion good.
BUT.----
I am not good to build good antennas and my
5w visper in the air.I have two dipoles in 3,7MHz
My QTH is Öland outside Sweden. SA7BMZ is my prefix.

I have seen a 40 W Linear Amp but I have not
picked up Where I can Order it.
When you ask for MKARS80 I can see this
40W Linear Amp with Wox. on Googles
Where can I find PCB and components for it?

Philippe

Check the BFO trimmer (C83) as been adjusted for 10MHz at TP 10MHz, if
so all should be OK.

Thank-you Steve.
Perhaps it is a better way to lern more about antennas and how to build them.
Climbing around on my roof of the house fasting my antennas and Newton vill take me down and Angels take me upp.
QRP with less then 10 W is fasinating.
I have very fun during the soldering fas and
to test the prodjekt. Then to sit for hours in QSO and tell another that the temperature is +9,5 deg.and the pressure is 1003hPa is not my type.

Hello Hans.
A simple and nice antenna is the center fed:
wire 2x20.50m and feeder 450 ohms (18m) at the end you use a MFJ - 948 (balanced output)
You need only one mast on your chimney (roof) . Ask to a slater for that! Stay with us ;-)

At home I have the same, with 1w in cw I go to suedeen... Norway and...USA from Brittany in France

Hello Tom,

It sound like you have no VFO signal reaching the micro-controller - I don't have a diagram available at the moment so can't give you references but check the voltages on the VFO transistor, the buffer transistor and amplifier which feeds the micro.

Can you tune anything in?

Regards,
Steve G6ALU

Hi Steve, i have done some measurements on all the transistors and IC1-IC4, used a battery with 12,8V when i measured.Only measured in receive mode thats becouse i dont have an mic/ptt ready yet.

I used the voltages tables as refrence, IC1 had: Pin1 1,36v, pin2 0v, pin3 0v, pin4 0v, pin5 6,4v, pin6 12,4v, pin7 6,3v, pin8 1,35v
On IC2 i measured 0,92v on pin 9 all other pin was ok.
IC3 had 12,2v on pin1, 0v on pin2 and 5v on pin3
IC4 had 12,4v on pin1 , 0v on pin2, 7,9v on pin3
Seems like most of the transistors from Q11-Q19 are lower in voltages than in the voltages

tables.
I have it all written down so if u need to now the voltages on some of them i have them.
And no i cant tune anything, hope this can help to find out whats wrong

Regards

Tom Kristiansen

Hi Tom,

Don't worry about measurements that are a few % out.

It doesn't sound as though the VFO is oscillating, check for dry joints,
solder splashes etc around the VFO - C59 and associated components.
Check that the wire on the VFO coil L5 "tinned" properly when you
soldered it in.

Let us know your progress.

Hi

Yes it was the L5 that i had to resolder so now i can tune the band but the noise is very low even if i turn the rf gain fully clockwise. I cant hear any diffrence at all when i turn the rf gain up or down, more bad soldering maybe ?

Tom,

IfL5 was bad I would be sure some of the other transformers have the
same problem

Find yourself a very hot soldering iron and try to resolder them - note
though that the background noise is only just audible with no antenna
fitted.

From: srleeman@btinternet.com
Topic: 2501 Message: 2501

Nearly there Steve! As I really did start from scratch, I only possess an AMU (kit) and a multimeter. Can you recommend where to get a suitable antenna and what kind, also a power supply and microphone (all cheap!)? I have been searching the Internet but there is so much out there to choose from.
Steve

2502. Short circuit!

Yahoo group: mkars80

Well there goes all the hard work. I carried out the very first test, before any power applied, the test where we apply positive lead to supply positive and negative lead to ground...and there's a short circuit!
I love the construction side, but I don't have the skill set for diagnostics.

I hope you can help me sort this out. You can imagine how disappointing it is. I won't be able to power up until this is sorted.

Stephen

Don't panic!

Check that the washers under the nuts on the potentiometers haven't shorted tracks out - it is OK to remove these serated washers. Unfortunately the control on the washer dimensions isn't what it could be.

Apart from that check the RF transistor tab isn't shorting on anything.

You can return the kit to me for service but I can't promiss a quick turn-round.

Thanks, Steve, I'll have a look. Meantime

I just check the schematic and tried to read diode D3....it is shorting in both directions where the other littler ones are not.

Could it be diode D3? Is it fair of me to ask you to send another hopefully with the package you are sending today.

Thanks
Steve

It isn't diode D3 just removed it from the circuit, reads fine

2506. Low cost power supplies and dummy loads

Yahoo group: mkars80
Date: 2012-03-06 12:15:59 UTC
From: hamlab3
Topic: 2506 Message: 2506

Is any one using a low cost power supply for the MKARS80, perhaps a wall wart or similar - interested in your experiances.

How about a low cost dummy load - not too hard to build with a bunch of resistors but is there any low cost commercial part out there?

Steve G6ALU

QRP Power Meter and Dummy Load

Steve Yates - AA5TB

AA5TB Meter Photo 1

HOME <http://www.aa5tb.com/index.html>

E-mail <http://www.aa5tb.com/e_mail.html>
Last Update: June 14, 2010

Many years ago I acquired a antique field strength meter and probe kit that did not function. However, the meter had a fast response time and a good enclosure and I thought it would make a good piece of test equipment. I designed the following circuit around what I had and it has worked out well for me.

The schematic below is of my QRP power meter and dummy (50 Ohm) load combination. The 50 Ohm load consist of resistors R2 through R5. The four 200 Ohm resistors in parallel combine to make 50 Ohms. I used four resistors because this minimizes the component lead inductance of the resistors as well as distributing the power dissipation. The meter is simply a current meter with a known internal resistance configured as an RF voltmeter. D1 rectifies the RF voltage across the load resistors and C1 charges to the peak of this rectified voltage. The capacitance of C1 is chosen so that the time constant of the RC circuit consisting of C1, R1 and the meter's resistance is long compared to the RF cycle. R1 is chosen so that when the RF power applied is 5 Watts the meter reads full scale.

QRP Power Meter and Dummy Load Schematic

The calculations are as follows:

Calculations

The internal resistance (Rm) can be found by constructing the simple circuit below and performing the following calculations:

Internal Meter Resistance

Adjust R until the meter reads it's full scale value. Be sure to start with R at it's maximum value to prevent damage to the meter. Solve the following equation to find the meter's internal resistance.

Internal Meter Resistance calculation

The formulae below are to convert the reading on the microampere meter to watts and back. Please note that the possible error caused by the diode's nonlinear response below about 100 mW has been ignored. The scale in the region of tens of milliwatts could be calibrated against a known calibrated power meter or signal source if desired. For more information regarding the very low power measurements with a diode detector you may want to check out <http://epic.mcmaster.ca/~elmer101/sqlaw/sqlaw.html> "Square Law Diode Detectors in 50 ohm Systems" presented by Glen, VE3DNL.

3rd time lucky..here's the webpage for a qrp dummy load and power meter.

http://www.aa5tb.com/qrpmeter.html

You can just make the dummy load without the power meter bit too.

I am actually using a 12V motor-cycle battery. I picked up two of them at a RSGB ralley last year for a fiver. I happened to have a car battery charger at home already, but found that it is easy enough to charge them from the main car battery as well while driving to the /P location!
The batteries last surprisingly long and even at 10.5V I still get 4Wtts out of my MKARS80

hope this helps

I wouldn't bother. It only makes it more difficult if you ever need to replace any. Mine are sitting in their places just fine through their solder joints, and assuming you don't plan to play football with the box, there shouldn't be a problem.
My -non technical- opinion.
My best dx so far with the bare box: UK to Croatia, getting 55 over almost 1400km.

I have seen it used - I use the same silicon adhesive used for "scrapbooking" - just make sure it says "acid free". Cyonacrelate (sorry cant spell!) has been used but this is a bit permanent.

No doubt other suggestions will follow but I wouldn't use wax - when it gest hot it flows all over the place and its a job to solder through once pads are contaminated.

I picked up an old citizenBand PTT mike at a ralley. The seller gave it to me for free! (it was the end of the day). Cut off the original plug and with a multi meter checked what wire was what and soldered on a 3 pin plug. Now I have a nice PTT mic and I get good audio reports. The mic is a bit big but who cares.

Hey group.

My MKARS80 was built several yeas ago and it drifts and jumps.

So I read there is a fix...and I found the write up. Can I buy the correct components from someone on here in the US?

Thanks

Mike WA3O

Does yours have green mylar or brown ceramic capacitors in the VFO (C59 and C60)?

2523. First Time Power up

Yahoo group: mkars80
Date: 2012-03-17 17:12:13 UTC
From: srleeman@btinternet.com
Topic: 2523 Message: 2523

I finally got to power up today, after the initial ohms and voltage checks.

But I only have a dummy load and I wondered if that would affect the adjustment of frequency. I can only get C37 to adjust down to 3.905 and no lower, where the suggestion is for 3.45. I can get over the top of the band to 4.02.

Am I missing an adjustment or do I need an actual antenna to adjust properly. Every thing else seems ok thus far, and I am working on a home made antenna.

Any help would be appreciated.

Hi,

Try and count the turns on L5, there may be too many.

My bad Steve...I got confused and wasn't using C38, just C37 front and back. Once I could get into C38 it varied the freq as required.

So it is working fine and adjusted to the right freq. Can't do any more till I get my antenna up.

Sorry, but thanks for reply.

Most of us use the a desktop microphone intended for PC use, you have to rewire and replace the 3.5mm connector though as the switch on a PC microphone just disconnects the microphone and we need it to connect ground to the PTT line.

OK, changing them to 1nF NP0 / COG types will make a significant
difference. There is also an update to the micro code (V2.4) - you can
either update this yourself if you have acces to a PIC programmer (code
on my website) or I can send you a new PIC and capacitors for GBP 5.00.

Regards,
Steve G6ALU

2529. Microphone for MKARS80

Yahoo group: mkars80
Date: 2012-03-21 13:53:19 UTC
From: srleeman@btinternet.com
Topic: 1944 Message: 2529

I can get a ptt microphone with either 4 or 6 pin Din plug, but I cant find an adapter for it to 3.5 mono plug necessary.

I hope someone can tell me how to wire my own 3.5 mono plug onto the 4/6 pin Din.

Reason I'm asking I tried to rewire a pc mic, but it had no PTT and what I tried didn't work.

Thanks in advance
Stephen

Hi Stephen If you get a socket to match the mic plug. Then wire the PTT and MIC at the back were appropriate to the mic. All you need to know is the pins on the mic. Then you got the audio and ptt in one go Phillip

Hi Steve,

I went out a bought the maplin mic and thought it would be a cinch using the picture in the group files, as you suggested.

It isn't clear to a novice like me where you want to place the 22k resistor, I know it is supposed to be in series with mic+ but I cannot get it to work. Also, you don't mention on the picture whether to remove the capacitor that comes with the mic. It isn't in the photo, but it doesn't say in the wording to remove it.

And is that the 22k that is in the picture, because it didn't come with the mike but the color code is wrong for 22k.

I would appreciate some help, as I am getting frustrated not being able to use the transmit function.

Thanks
Steve

Hi Steve,

That must be frustrating! If you want, you can skip the high pass filter (the resistor and capacitor) and just connect up the mic capsule and switch properly and everything should work fine. You can add in the filter later once you get talking and have other ops give you their opinion of the sound.

This is my first posting here. The kit looks very nice and there are many nice looking rigs in the pictures section here! I've built a bitx20 ver3 but the case is not quite complete yet.

Cheers to all and have a great evening!

Topic: 1944 Message: 2536

A big congrats and pat on the back Steve :-)

Well done! I still remember when I passed mine -- I was very nervous, but happy I could do the theory tests well and could pass the Morse code test.

Most of the standard rig mikes are either unpowered low output, or battery or line powered high output ones -- it pretty much depends upon the age of the mic. I don't imagine the mkars mike amp is set up for low powered ones, but the other types should work fine. Battery powered ones will need to have the resistor set up to give power to the electret capsule removed, line-powered ones could be set up to use this power if wired correctly.

Yep, you'll have to search to web a bit to find the pinouts for the mics. If they are name brand ones from a rig manufacturer that should be easier.

Cheers and congrats again on your test :-)

73s,

Mark/n7eku

First, are you adjusting the tuning range with the orange trimmer? The most likely cause is too many turns on the VFO inductor - see if you can count them.

From: srleeman@btinternet.com
Topic: 1944 Message: 2541

Thanks Mark that is kind of you. I'll get my callsign later this week.

The microphones are antique CB ones with now internal power supply.

I am only working with screen, red, black and yellow.

I've tried various combinations. Only screen and red have continuity when ptt is pushed. I can get the resistance of the mic .456 ohms between yellow and red. I just don't know what to do.

But Steve here at the group is a big help, and hopefully we'll get there. I just feel kind of stupid, feeling it should be easy to sort.

Hi

The C45 : 100pF is also critical - my part was not COG , and it was a desaster, with at least a jump in each qso ! - With a COG type, the MKARS is now very stable and quiet...

Stephen,

Ignore my private email...

If you have continuity between screen and red when the PTT is pushed
take screen to ground and red to PTT - if you hold the PTT in do you get
a "click" through the microphone when testing between screen and the
other wires? If so the wire that "clicks" is the microphone wire.

The 100pF for the VFO which I supply are (at least should be) NP0 / COG.

2547. Re: Microphone for MKARS80

Yahoo group: mkars80
Date: 2012-03-28 10:42:55 UTC
From: Steve
Topic: 1944 Message: 2547

Hi all,

Just thought the following might help some group members new to the hobby - a very simple way of arranging the PTT and mic connection for the MKARS80.

For me, my PC headset works very well. To avoid cutting and re-wiring the mic cable, I made a little adapter / PTT box. This way, I can unplug it and put it back in the PC for Skype etc.

The adapter / PTT box is very simple - all cheap Maplin stuff.

- Small plastic box (or a metal one if you're worried about screening)
- 3.5mm stereo socket
- 1 metre of twin core screened audio cable
- Instantaneous push switch (I chose the smallest panel mount one they had on the shelf)

With the above, the PTT and mic connections are made between the cable, PTT switch and 3.5mm socket, following Steve's instructions for wiring the mic. The cable goes through a hole in the box and connects directly to the PTT switch and 3.5mm connector.

Nice and easy, and with this you get to be able to try out many PC type mics without cutting cables, and have a nice PTT arrangement too.

For avid kit builders, this also works for the Walford Electronics kits too - as he uses the same tip and ring arrangement for his mic / PTT.

PS. The headset. I only use this through the headset socket on Steve's CW adapter kit - using it directly from the rig is not advised!!

73,

Steve MW0KST

Andy,

Stephen is having similar problems as well, I'm going to try and help by doing a check list but it would probably help if you had an oscilloscope - do you have access to one?

OK Andy,

I will take measurements with an RF probe, if you have done a DC voltage check and everything is in order then the problem can only be found by taking RF measurements.

RF probes are simple to make, I will do some experimentation today in preperation.

Hi Folks!
It is an intresting thing i have named my MKARS80 the rabbit radio.
It is funny litle rig it does just the same thing as a rabbit when it feels the heat i jumps one step to the left. eg. abt 1,3 kc. I guess the huf and puf just lost the grip of things.
The advantage of this is that it has teached me to make short calls hi hi.
So, as l do like my MKARS 80 is the thing to do to change C45 or is there something more to it.
Have a happy Easter and 73 de SM4LRA / Christer

Hi

The C45 : 100pF is also critical - my part was not COG , and it was a desaster, with at least a jump in each qso ! - With a COG type, the MKARS is now very stable and quiet...

2555. Antenna suggestion - thinking of building mkars

Yahoo group: mkars80
Date: 2012-04-08 10:07:54 UTC
From: DaveP
Topic: 2555 Message: 2555

Dear All,
I passed UK foundation exam last year and am currently studying to take intermediate exam in a month or two time.

While I have a yaesu ft-8900 radio and a multiband antenna for that, I don't have an HF antenna that would do 80m.

I am seriously thinking about ordering/building the MKARS and I am not sure what would be the most obvious antenna to buy/make to go with it. I do have fairly long garden, but not very wide and hedges either side.

I was thinking of a tripod vertical as I could then have that in garden or take it elsewhere..

http://www.hamradio.co.uk/aerials-antenna-manufacturers-mydel-antennas/mydel/chapstick-complete-pd-2903.php
or perhaps
http://www.sandpiperaerials.co.uk/index.php?main_page=product_info&cPath=63&products_id=281

What do other people use? To be honest, I guess the above feel in someways like overkill...
What's my simplest choice?
Thanks for advice.

Hi,

Simplest choice is a centre fed dipole if you have a long enough garden for it, even simpler is an end fed quarter wave but this will require a good ground and then best to run the MKARS80 from a battery supply.

Dave
I have an 80 meter dipole but my MKARS 80 gets a lot of use sat out
on a sunny day with it feeding a simple to make loop.
Works very well, low noise and it's somehow fun to see the little rig and loop working together...
Tunes up beautifuly..
Link here...
http://www.hard-core-dx.com/nordicdx/antenna/loop/loop80m.html

Good luck with the kit when you get it, great fun to build and it
works a treat..

Regards
Philip G4JVF

2563. Special event station at Bletchley Park using an MKARS80

Yahoo group: mkars80
Date: 2012-04-21 07:23:43 UTC
From: Steve Drury
Topic: 2563 Message: 2563

Hi all,

Just to let you know to look out for a special event station at Bletchley Park this Sunday, the operator will be Rick Brand G0SJR and the call sign will be GB3RSS. He has a good antennae (dipole) so inter G and some DX should be possible.

The station is in commemoration of the Radio Security Service who are holding their reunion in the Mansion.

Steve G6ALU

Hello Steve.
Was nice to meet you on Sunday, and talk briefly about microphones, and other matters.
Will be starting on the Hunter this weekend, once I've finished the daily stints of gardening. I started the training for this today, I have a mountain (30 odd) of
Signal processing pcb's at work to have a couple of components corrected, all SMD stuff and someone else couldn't read the markings either.

Hello John,
If the variable cap' is damaged then you may find it
easier to snip the leads a few mm above the board to
remove the cap' and then remove the lead with pliers
whilst heating the joint. To open the hole to allow the
fitting of a new cap' use a large needle and push through
the hole again whilst heating the solder.

Thanks again Ken,
In the meantime I bought a very fine cutting tool and managed to remove the polyvaricon as you suggested. The rest should be reasonably easy.
John. VO1JCC.

My MKARS80 is still waiting for getting finished.
Any hints?

Sorry Andy,

I've been assigning too much time solving other issues - I will
concentrate on yours now.

A diode probe will require either a Germanium or Schottky diode - I
wonder if you have any of either? If not let me rough up a circuit then
I can send you the components.

Steve

Hi Steve,

I´ve got rf probes for my multimeter, so if you tell me what to measure I will try.

Andy,

As I don't know how or what your diode probes will read, I have loaded a
file to the group which include my probe design and tabulated readings
from the important test points - see announcement - try it and tell me
the result.
You may have to scale your readings depending on the RF probe design.
The first two readings could be used as a reference as they are from the
oscillators.

From: F5mpw
Topic: 2579 Message: 2579

Hello!

I saw on this site a very nice inside quad antenna for 80m. At this time I can't find this message in my computer. Someone has this link? Thank to send me it ;-)
Always nice reports and comments for the Mkars80. With it, 58-59 betwen Rennes to Brest...
Perhaps my antenna is nice, but MKars works very well!
Good evening!
73 philippe F5MPW

Hello Philippe
I'm not sure if what you are looking for is on this page but there are a
lot of interesting ideas!

They are just basic ideas but if you see something I'm sure you can find
out more. I built number 48 for my main station, the details were
originally in a German magazine then QST.

Here is the link
http://www.qsl.net/va3iul/Antenna/Wire%20Antennas%20for%20Ham%20Radio/Wire_antennas_for_ham_radio.htm

Scroll down the page to see the pictures or pick something you like from
the list.

Good luck!
73,
John.

Thank you John for this link, a lot of antenna, very interessing. The antenna that I am looking for was on this group someone gave this idea. It was for inside with many turns on a square for 80m... I think somebody conserve the link... But with this nice weather, I will be in the garden to lawn the grass ;-)

Hi Philippe
I looked through the old messages in the group and came up with the
following by Philip G4JVF :-

I have an 80 meter dipole but my MKARS 80 gets a lot of use sat out
on a sunny day with it feeding a simple to make loop.
Works very well, low noise and it's somehow fun to see the little rig
and loop working together...
Tunes up beautifully..
Link here...
http://www.hard-core-dx.com/nordicdx/antenna/loop/loop80m.html

73,
John.

Philippe, this is what you must be looking for.

http://www.hard-core-dx.com/nordicdx/antenna/loop/loop80m.html

I bookmarked it and saved it as a pdf as I plan to try it. If effective I intend to hinge the middle so it will fit easily into the back of the car.

Hello!
What a pleasure to see the good link. Yes Styve it's this antenna I should like to try... it's not very difficult to build about 20m of cable and capacitor...
thank you everybody for your help...
next time!

Philippe,

Compared to your dipole, it won't 'get out' as well IMO (unless your dipole is too low) but it could be very useful for local contacts if you have a lot of local interference as you can 'null-out' the interference.

In my experience they are no better than a short, random wire for transmitting, but they do make a good RX antenna =]

Ok Jon.

My center fed is hight above the ground (12m (on left) 17m (center) and 22m to the left in a tree... it works well. Ok for the other antenna small and inside... I want in few months to install a cubical quad on 20m and other bands... Pehaps, one days we will try a contact... in a morning...
All the best 73 philippe F5MPW

Philippe,

Compared to your dipole, it won't 'get out' as well IMO (unless your dipole is too low) but it could be very useful for local contacts if you have a lot of local interference as you can 'null-out' the interference.

In my experience they are no better than a short, random wire for transmitting, but they do make a good RX antenna =]

Regards,

Jon Point

2589. Low Power Output

Yahoo group: mkars80
Date: 2012-06-10 18:40:18 UTC
From: simonmcgraw@btinternet.com
Topic: 2589 Message: 2589

Hi Steve.
I have a low power output on MKARS80.
The DC voltages all seem to read fine.

I have finally got round to using an RF probe (http://n5ese.com/rfprobe1.htm)to check the RF voltages.

Your instruction sheet said to use 12v to check the voltages, is that right? (as opposed to 13.8v) I get 3.28w output on 13.8v and 2.50w output on 12v

Test Point Table 13.8v 12v
Q13 Coll 1.1 0.53 0.51
Q16 Emit 0.66 0.43 0.37
D20 anode 0.85 0.41 0.29
Q21 base 0.2 0.13 0.10
Q21 coll 0.28 0.11 0.08
Q20 base 0.2 0.08 0.06
Q20 coll 1 0.8 0.7
Q9 base 0.3 0.04 0.01
Q9 coll 3 0.05 0.01
Q5 base 1.5 0.3 0.3
Q5 coll 8.5 6.5 5.7
Q1 drain 13.5 8.5 7.8

Is the problem around Q9?

Thanks for your help

Simon

Simon,
Looks like your probe is reading about half mine - perhaps yours is RMS
reading?

The voltages on Q9 look low... I'm not sure they help to diagnose the
issue.

Looks like it I will have to diagnose this one myself, before I do this
though please count the turns on the LPF inductors.

Hi Steve

L1 and L4 have 30 turns but measure 2uH (circuit diagram says 2.7uH)

L2 has 32 turns but measures 2.6uH (should be 3uH)

Do I need to add a few turns until the inductance is right, then try again?

Thanks

Simon

PS Yes my probe is an RMS one, I will build another like your diagram

Don't worry about your LPF... shouldn't attenuate a wanted signal
anyway.

I'm out of ideas Simon! Do you want me to have a look?

Topic: 2589 Message: 2594

Hi Steve
I have finally found the problem....it is not the MKARS80, it was the digital swr power meter reading about 2/3 of what it should. Testing against a 50ohm dummy load (http://www.k4eaa.com/dummy.html) and doing the power calculating, my 3.28w output magically became 5w.
I have checked all the toroids on the detector head, all 23 turns, T2 is wound the opposite way to the other 3.
The meter is calibrated to the 23.1W forward and reverse on TP9.
I rotated R31 fully clockwise and it would not go up to the dummy load power value.
The voltages on U3 pins 123 567 are all 0.3v up on the test values.

Do you have any suggestions as to where I need to look for a fault in the power meter?

Thanks a lot

Simon

Oh dear... should read very close to 3.9 Volts, can you check the value
of resistors R14 (4k7) and R15 (8k2) also that U1 is fitted the right
way round!

If all OK please send me your address by direct email so I can post you
a replacement reference chip.

Thanks,
Steve G6ALU

2598. MKARS80 completed successfully

Yahoo group: mkars80
Date: 2012-07-02 01:24:24 UTC
From: johncronhelm@nl.rogers.com
Topic: 2598 Message: 2598

The project is completed finally after 15 months,interruped by by illness etc. Main problems were of my own making. There were a few cold solder joints and a blown final transistor probably due to use of a temporary heat sink without installing a silicone insulator and also a shorted mike connector. Thanks are due to Steve G6ALU for his ever ready advice when things didn't go so smoothly. My question now is when is there going to be a MKARS40 kit available?John, VO1JCC.

Hi John

I'm sure Steve will come back with the 'official' answer but the 40m version was the subject of several emails which started in mid February 2009.

I know that Ron PA0RCL tried a modification but I lost track of the final outcome.

Glad you got it completed though, have fun.

73,

John.

Morning,

I modified an MKARS80 to 40M but there were some problems, all were resolved except the need for AGC... perhaps I will look at this again sometime.

Steve

2601. Battery Power for MKARS80

Yahoo group: mkars80
Date: 2012-07-02 22:55:43 UTC
From: johncronhelm@nl.rogers.com
Topic: 2601 Message: 2601

I use a 7 amp hr. Gel Cel battery for my rig which works well but a bit heavy to carry around for portable use. I get the impression that 8 AA Batteries in a holder might not deliver enough amperage for 5 watt output on transmit. Am I correct? What other type of battery set up could I use?Thanks, John VO1JCC

I read on Ron's webpage that the 40m conversion of MKARS80 was a non-starter
See: http://www.pa0rcl.com/PA0RCL/MKARS40.html

But if there is going to be a -40 version I'm sure to get it!

From: simonmcgraw@btinternet.com
Topic: 2589 Message: 2603

Hi Steve
I had full power for about 10secs, then no power output (again!)
Using the Tx data sheet, my Q16 emitter is)0.632v but the anode of D20 is 0.118v, does that mean Q22 has died?

If so, is it a "B" class amplifier?...the BC 547s appear to be available as A, B and C class amplifiers

Thanks a lot

Simon

2604. Hiss only, no output and Hello!

Yahoo group: mkars80
Date: 2012-07-08 20:42:41 UTC
From: stu_m0mmz
Topic: 2604 Message: 2604

Firstly, Hello, I'm new to the group.

I was fervently reading through many topics on Friday before posting here. This topic has been covered many times and usually has the same output so I've tried things first.

I have successfully built my MKARS80 a little while ago. Unfortunately, due to incorrectly picking the wrong grounding point, my initial voltages were wrong. By the time I realised, later the same day, I had already taken out and re-soldered many of the components so my board isn't half as pretty as it was when I first completed it!

Now, having the correct initial voltages, I now seem to have a common problem.

When putting power to the board, I get a low-volume hiss out of the loudspeaker, as expected, but nothing more. I have connected a good antenna to it (which I tested with another rig). I tried another speaker too, but got the same thing.

I have tested thoroughly all my transformers, including remaking two of them, checking that the enamel has been removed before soldering them in, checking the joints once they were soldered in and so on. I have also taken them all out at least once and re-applied them. I'm 99.999999% convinced that there are no bad joints on them and that the enamel has definitely been removed. They aren't short-circuited or anything like that.

So where to start? Any other ideas? Anything else I can check?

I have put the IC in place as well as the display. The voltage on screen is good, I've got the display showing the correct frequency. I've checked the voltages on the 2 ICs and whilst they aren't wildly out, they aren't quite as perfect as the voltages at R34 and VR2 (these two were right to within 1/100 of a volt).

Hi, welcome to the club!
80m conditions have been very bad. Did you check on another rx that there were signals receivable?
If you don't have another rx, you could use one of the websdr stations, choose one nearby, if there is.
See www.websdr.org. If you're lucky, you could hear yourself !

Rgds,

Michael M0MPM

Hi Michael,

Whilst I accept that conditions weren't brilliant, I also have an icom IC-718 rig which I tested and seemed to be picking up the usual Italian stations chatter at the time which was why I was surprised that the MKARS80 was so deaf.

This was on Friday afternoon btw. I have just checked again - I can hear quite a bit of activity on that, but nothing beyond a low-volume hiss on the MKARS.

Even if I couldn't hear anything, I would expect the hiss to go up and down in tone if nothing else.

Cheers for taking interest in my post though and taking the time to reply.

Hi Stu, unfortunately I cannot much other advise,it almost sounds like the antenna is internally not connected, but I suppose you checked for those obvious things.
I was lucky that despite my limited experience in building things, the mkars80 worked first time, and I made dozens of contacts, especially contests are great for testing it out. My best dx is about 1500km, all barefoot (ie 5 watts) on a end fed inverted L antenna.
Having said that,I actually did have one loose connection which was one of the coils, but wiggeling it quickly showed were the problem was.
The effect was the same as you described,so you may want to check because those wires are somewhat difficult to solder properly.
Wish you good luck, at least you have another rig to get on the air - and so have I - an ft757 - I'll be running GX4WAB on wednesday morning from about 6am to 10am on 40m at 7160+/-qrm so you may catch me there!

Morning,
The hiss will be coming from the audio amp, the LM386 is a little
noisey when set to high gain.

Does it transmit at a reasonable power, 4 to 5W? If so its likely the
transformers are wound and fitted OK, if not then re-visit them. If its
not the transformers then DC checks normally find the problem.

There was a list of RF voltages in a the files section, see:

http://uk.groups.yahoo.com/group/mkars80/files/MKARS80%20Fault%20finding/

These will help fault finding in TX mode.

Let us know how you get on....

Hi Stu. Here is something simple to check. I had this" his"for a time until it was discovered I had a dud BNC connector. i changed it and all was well with the receiver. Check to see if the centre pin is intact.

Thanks John. Something I hadn't considered. I clearly checked and double checked my antenna connections, but not the actual connection from the board through to the adaptor.

I'll try it tonight.

Thanks Steve. I wanted to get receive working before I moved onto Transmit. The hiss from the audio amp is actually quite welcome - it shows that something must be working!

I read about the transformers from a previous poster who was having the same problem. I'm not sure he ever fixed it!

2612. No power output

Hi
I am trying to trace the transmit power through the circuit. Everything is fine up to Q21. At Q21 I have normal DC voltages, 0.2vRF using Steves RF probe at the base and negligible RF at the collector, I have tried 3 different BC547s which has made no difference. I took out T6 and the RF voltage came up to 0.28v at the collector Q21. I have re-wound T6 put it back and there is again negligible output at the collector of Q21.

DO you have any suggestions where I should go next?

Thanks a lot

Simon

Hi Simon,
Is D17 correctly orientated, probably is but just in case!
John.

Hi John
Yes D17 is the right way round.
Thanks for your thoughts
Simon

From: pe1fjn
Topic: 2617 Message: 2617

MKARS80 People,

Was able to construct T1340 and T1380 where I added a 10 turn bourns and dial to make easy tuning possible.9QRZ.COM) Similar stuff I plan to implement on the MKARS80 kit from the start, now just starting, just completed BAG1 (HI).

I'm considering to purchase a 1:6 reduction gearbox from Elliot company.

Does anyone experience with similar solution?, and know where to buy in Europe, so far I found address in the USA only.

Topic: 2617 Message: 2618

Hello Marc
On my MKARS80 which is in its original case I fitted one of these 10:1
drives http://www.mainlinegroup.co.uk/jacksonbrothers/6020.htm

Jackson Brothers who made them have had problems and I'm not sure if
they still exist but I called the distributors Mainline Electronics and
they are starting production.
They have the 6020/1 in stock but production of the 6020/2 has not
started yet and they think 4 - 6 weeks.

I bought 2 of each, used 1 and gave the other to a guy in California
because he couldn't find something which he knew was suitable.
I have 2 of the 6020/1's left so I assume I used the 6020/2 on the radio.

They are very small and fit very nicely with no real modifications
needed apart from cutting the knob shaft to length.

If you need any more info please ask.

Very best regards,
John.

Hi All ,
Wanted to let you know how wonderful the MKARS80 is. Within this week I have made a contact with England and another with Denmark running 5watts into a vertical antenna around 0030 Z 3.789 Mhz. The signal strength received was low but enough to be readable. I look forward to making contact with another MKARS80.during the autumn and winter.

Hi John, It is a great kit I have also managed a transatlantic QSO with an OM on Prince Edward Island, my antenna is a fullsize G5RV folded into a horizontal open ended delta loop, this way it only takes up 1/3 of the space and just fits into our small back yard.

I need some sort of AGC as I am often portable and need to use heaphones it is something I am still looking into.

I look forward to a QSO with you on the MKARS80 one day when conditions allow it.

From: pe1fjn
Topic: 2622 Message: 2622

Just to share an experience with transformes T1,etc.:

I was very worried about the transformers, but with a low cost temp controlled solder iron adjusted at 360-390C, it easy to solder the wires succesfully to the boards.

The "production" of transformers is fun and I like it.

From: pe1fjn
Topic: 2623 Message: 2623

So today I completed most part of the kit, and was able to connect the RIG to the antenna 19:00UTC, very fine RX tonight on 80m, many many strong signals come trough in SSB.

Now 2-3 weeks no time to complete kit, so true TX after drilling holes in the case most likely in October, again the RX quality is big nice surprise for me. The LSB filter is very fine, and the RX has no problems with many strong, unbelievable strong, OZ stations now on the band.

73
PE1FJN

Now uploading RX test to youtube, can be found later today on cwqrp

Has the BFO been correctly set? Best to set accurately with a frequency
counter.

Has the PA transistor bias been set properly?

Could be the electret but they are normally quite good, what type is it?

Hi,

Might I offer a couple ideas?

I think since you say your set receives very well, then maybe your BFO setting is not too bad.

Do I understand you correctly when you say you are injecting audio from an external source, that you are putting the mic up to a radio that is playing some bbc broadcast and then listening on another rig close by?

If this is the case, then I would think the microphone is OK. And when on dummy load your sound is good, but on an antenna not. This would point to RF getting into your mic amp and you will need some isolation there.

On a dummy load, your SWR is perfect and the dummy radiates RF only a little bit. But on an antenna your SWR can be a bit off and your feedline, and antenna if it is close, can radiate a lot of local RF. This then has a chance to get into your mic amp and cause lots of trouble.

You might then need an RF choke inside the rig on the mic line. Sometimes folks also put a cap from base to ground on the mic amp transistor to shunt RF to ground there too.

73 and best of luck,

Mark.

Mark,

For the MKARS80 there is no problem with RF break through into the microphone amplifier, I'm assuming of course that the microphone lead is adequately screened.

Please refer to the diagram; there is already a 1nF decoupling capacitor on the microphone input (C15).

Regards,
Steve G6ALU

Thank you for the information Steve,

My mistake I didn't look at the schematic first -- you have planned better than some other kits I have made :-)

Electrets are normally pretty reliable, but I one can get a bad part once in a while I'm sure. Hope he can get it fixed soon!

73 and all the best,

Mark.

I'm glad it worked for you in the end Simon.... so often its a problem
with the mixer transformers, I could have gone for a module but they are
at least ?5 each!

At Q21 I have normal DC voltages, 0.2vRF using Steves RF probe at the base and negligible RF at the collector, I have tried 3 different BC547s which has made no difference. I took out T6 and the RF voltage came up to 0.28v at the collector Q21. I have re-wound T6 put it back and there is again negligible output at the collector of Q21.

Yes, my MKARS80 is alive, 1st QSO made !!!

I connected it to a KENWOOD Headset, KHS-21, seems to work very good, 5W without any problem.

Look forward meeting other MKARS80 stations.

2637. MKARS80 net Saturdays 05:00-07:00 UTC on 3.680 MHz

Yahoo group: mkars80
Date: 2012-09-24 07:18:48 UTC
From: woodiescbj
Topic: 2637 Message: 2637

Hi to all members of the group, I am going to try and start a MKARS80 net on Saturdays starting on 29/09/2012 from 05:00-07:00 UTC on 3.680 MHZ, or 3.780 if QRM, everyone is welcome to join in including non MKARS80 users, my antenna is either a homemade 30m long delta loop 7m high or a homemade W3EDP ant 7m high which may be better for 80m band, I hope to put one up on Friday afternoon.

I look forward to a MKARS80 QSO with you.

Vy 73 de Colin DD5CF in Bonn JO30NQ

2650. MKARS80 net every Saturday 05:00-07:00 UTC on 3.780 MHz

Yahoo group: mkars80
Date: 2012-09-29 07:51:48 UTC
From: woodiescbj
Topic: 2650 Message: 2650

Hello to all members of the group, this didn't get off to a very good start (no contacts) the band was very noisy, I will be trying again next Saturday 06/109/2012 from 05:00-07:00 UTC on 3.780 MHZ (which was clearer), or 3.680 +- QRM, everyone is welcome to join in including non MKARS80 users and SWL's, please QSL via EQSL.COM.

my antenna is either a homemade 30m long delta loop 7m high or a homemade W3EDP ant 7m high, which may be better for 80m band, I hope to put one up on Friday afternoon.

I look forward to a MKARS80 QSO with you.

Hello Philippe

What photo's are you looking for in particular? There are some very good ones in the manual which you can download or I can forward a copy.

73,
John.

Hello John.

Yes, I saw the nice manual, I wondered if the enclosured was not larger and longer for the pcb, I understood it was the same as mkars 80...
Your are near your pc at this time???

Hi Philippe

Just making breakfast!

I saw the enclosure at Hamfest last week but I can't remember it too
well. I've built mine into 2 boxes, a plastic one for the main part and
an aluminium die-cast for the measuring 'head'.

73, John.

Good breakfast John!

I ordered with the enclosure option. I will built this kit in next november or december...
Before we have a qsy in Maroco, if you want to follow us with internet, it's possible, I have a special adress, every day I will send photos, if you are "interested" tel me.
For me about 10 o clock...

Sorry about the delay Philippe!

The problem I found when I tried to put it into a case was that the
buttons were in the 'wrong' place for everything I tried.
Eventually I put it in a small box that I bought at a rally and arranged
it so that the buttons were on the back and the display was sitting
above the main PCB.
I did that by making up a small right angled plug/socket arrangement for
the display, the only problem is that R31 is difficult to reach now. The
box has a place for a 9v battery too so that is useful for QRP.

Good luck with the kit, it's very good as you would expect from Steve.
Have a great trip.

73, John.

Topic: 2660 Message: 2660

As a few stations told me that I have some distorsion , I put a two tone generator (dgen fr DL6AK) at the mic input (with a potentiometer to adjust the level) - before, I have adjusted carefully the bias current and the mixer balance. Up to 2,5 W , the scope shows a good picture, but over it looks saturated. Has anyone done the same test ? Any idea to increase the linearity ? Will be on 3.780 on Saturday morning, but not before 7 local hour...

From: Mark
Topic: 2660 Message: 2663

Hi Pascal,

Just curious for some details as some of the following can limit your power output and may limit you to 2.5W max linear output from the amp...

What supply voltage are you using? The power output of the IRF510 drops off quite a bit as the supply voltage goes down.

Is the 2.5W into a dummy load or an antenna? I am asking because as the impedance at the antenna terminal goes above 50ohms, then the power output can also drop.

I have done two-tone tests also on my single IRF510 amplifiers, and they usually go closer to 5W or 6W (at 13.4V into a 50ohm dummy load) before flattopping.

If you are using an amplified microphone, maybe that could introduce distortion if the mic amp gets overdriven?

I hope this can help a little bit, but maybe the designer will have some better ideas.

Congrats on your QSO with your MKARS!

73,

Mark/n7eku

Hello Pascal,
The IRF510 isn't the best device for linearity as it is intended for switching applications but its normally quite acceptable for QRP use.
It's worth using a scope to look at the collector waveforms through the TX stage to make sure there isn't one limiting early, I've had several causes for this; wrong turns ratios on transformers, broken track to emitter decoupling capacitors etc.
Regards,
Steve G6ALU

Hi Mark,
Thanks for your answer
Power supply is 13.5v, tests made on a 50 ohms dummy load,
New tests done shows a 200 hz modulation only on a two tones signal, not on on a single tone, like if a carrier frequency was still there, but I have made carefully the mixer adjustment, so...I don't know where is the fault.
But the main distorsion was coming from the mic. A 1MF added on it has almost solved the bad audio reported by the hams, so it can work as it is until I have a new idea to study.

Ok John, if you have a camera, a photo will be interessing...

At this moment, in Brittany it is raining, temperature 16 degres, no sun... pression 1015 hpa...
What sorte of antenna have you at your home?

Quand j'aurai installé ma cubical quad, nous pourrons faire un essai.
Le plus compliqué sera de se comprendre en anglais ou en français ou les deux...

A bientôt John!

Hi Pascal,

I must have been sleepy last night as I forgot one important thing about the two tone test. That is that one usually only realizes about 1/2 of the typical power output before flattopping. When I was thinking about mine, I forgot that part and was giving the figures after the test when I switched to one tone to check the real output. If you switch off one of the tones, then you should get 5W to 6W out. I don't think there is anything wrong with your amp :-)

The 200Hz is probably the difference between the two tones. On a single tone, you should indeed no longer see it and will only be able to see a transmit frequency waveform.

You have an electret mic, or a dynamic or transistor amplified dynamic? Where did you place the capacitor? Anyway, some RF getting into the mic line can cause trouble and extra filtering like that can for sure help.

Have a great weekend :-)

73,

Mark.

From: John
Topic: 2651 Message: 2668

Hi Phillip

I built my SWR Power meter in the case that came with the kit.. It is not the same size as the MKARS 80 case.

I have uploaded 3 quite poor photos to the site

They are not there yet as waiting for the moderator.

Look for the under G3YOU MKARS 80

If you follow the drilling instructions given with the downloadable templates you should be ok

Hope this helps

Good luck

John

From: Pascal
Topic: 2660 Message: 2669

Hello Mark,
In this case , my TX should be good. I will check next week if I get this 200 hz modulation on a few other TX (only seen with the two tones in a ratio around 1 to 2, tests made with different values). The mic is a usual low cost mic for computer, on which I have added a LF compressor, with level adjusted to the same as without it. I agree the distorsion came from the mic, and the capacitor has done a great job. I have now to test more on the air with local stations and with other mic.

--- In mkars80@yahoogroups.co.uk, "Mark" <mark7311@...> wrote:
>
> Hi Pascal,
>
> I must have been sleepy last night as I forgot one important thing about the two tone test. That is that one usually only realizes about 1/2 of the typical power output before flattopping. When I was thinking about mine, I forgot that part and was giving the figures after the test when I switched to one tone to check the real output. If you switch off one of the tones, then you should get 5W to 6W out. I don't think there is anything wrong with your amp :-)
>
> The 200Hz is probably the difference between the two tones. On a single tone, you should indeed no longer see it and will only be able to see a transmit frequency waveform.
>
> You have an electret mic, or a dynamic or transistor amplified dynamic? Where did you place the capacitor? Anyway, some RF getting into the mic line can cause trouble and extra filtering like that can for sure help.

Bonjour John.

Merci pour toutes les explications. J'ai bien compris.
J'ai vu les photos de G3YOU.
j'ai aussi ma réponse: la boîte ressemble à la boîte du MKARS80 mais n'a pas la même taille! C est OK

Ici, la pluie, le ciel est gris et la température est de 15 degrés.
J'ai choisi des mots simples, je pense que vous n'aurez pas de difficultés pour me comprendre.
Passez une bonne journée!
73 philippe

2672. Display frozen

Yahoo group: mkars80
Date: 2012-10-20 06:59:05 UTC
From: dd5cf_colin
Topic: 2672 Message: 2672

Hi to all members,
I have been running the MKARS80 for about two years with no problems, this morning the display has frozen a couple of times (for two minutes now), turning the rig off and on the display stayed blank at first but came on again after repeated switching I can tune up and down, RX and TX OK just the problem with the display, I did notice that I had about 6 random characters show up in the Huff_Puff part of the display but they went away when I restarted the rig.

Any ideas would be appreciated.

Vy 73 de Colin DD5CF / G1ZOS

Hi Colin,
I had a slightly different problem with my display. It went wild and frequency went all over the place. I finally traced the problem to Q13,one of it's leads had a poor solder joint. It might be worth checking out this transistor. Hope you can fix it soon.

That could be a good candidate, also worth checking all the display connections are making through the pin and socket arangement.

Hi Pascal at all!
I was listening and calling with my MKARS80 at 3.690-92MHz and I was listening also the the SDR radio at www.nachtuilen.net
Zilch! nothing!
The band was at its low. I was scanning down to 3.650MHz, listening to signals just above the noise floor.
Better luck next time!

Hello Panos,
I suggest 3650 if 3690 is too crowdy as it was the last days - Hope to hear you ! 73 fr Pascal

2686. SSB 80m CW Contest in Holland 18/11/2012, see link

Yahoo group: mkars80
Date: 2012-11-17 10:28:44 UTC
From: pe1fjn
Topic: 2686 Message: 2686

Tomorrow there is a nice 80m SSB contest.

Little late for 80m SSB but stations from North Part of Holland will be QRV with good antenna's from noise level low area and good ground conditions, so it's a good chance to get in touch with Holland in SSB.

I plan to install later today a 80m coil loaded Dipole for good radiation efficiency and radiation to the sky with high 90 degrees elevation angle.

Details: http://www.pi4lwd.nl/index.html

Have fun

73
Marc

From: beano325
Topic: 2687 Message: 2687

Hello everyone

Bought my MKARS80 at Kempton park last sunday, couple of hours every evening and it's finished and working this morning!

My only issue was very low output power, checked all transistor voltages and found Q9 was 0v on all pins. A quick look round and poke soon discovered T3 wasn't soldered properly.

Just had a quick Qso with my mate across town, and he says it sounds good, if a bit off freq.

It was a joy to build and It's a shame I've finished :)

Hope to catch one of you on the MKARS net.

Cheers
James

2688. LED NOT FLASHING AT HIGHER END OF BAND

Yahoo group: mkars80
Date: 2012-11-18 08:30:12 UTC
From: barrie2emma
Topic: 2688 Message: 2688

Help please. Modulation light will only flash from 3.59 - 3.619
and it shows full power on the meter. The higher it goes the lower the power reading? Apart from that all other function are working correctly and very good on RX.

Any help please?

2689. Re: LED NOT FLASHING AT HIGHER END OF BAND

Yahoo group: mkars80

From: pe1fjn
Topic: 2688 Message: 2689

Could give it a try to help.

But need more information:

Need to understand if your MKARS80 produces at least a CW carier at the planned frequency, so the PWR output is from the VFO in MKARS80.

1)Did you try to listen on SW receiver, dummy load on MKARS80 and no antenna on RX, and what did you hear.
-Just a carier?
-Carier with side band modulation?
2)does the frequency match on RX roughly match with the frequency on the MKARS80?

If the signal is at the right frequency, and a pure carier, something wrong in the Audio/RF SSB mixer/balans modulator.
If you have modulation, but just also a continues carrier, the balance modulator is out of balance. Check diode polarities, make sure transfer is connected fully, not easy to check, need maybe just resolder at high temp all trafo solder points.

Let us know what you found , I will check mail from forum daily.

2690. Re: [mkars80] LED NOT FLASHING AT HIGHER END OF BAND

Yahoo group: mkars80
Date: 2012-11-18 21:11:57 UTC
From: Steve Drury
Topic: 2688 Message: 2690

Barrie..
Do you have to shout into the microphone to get the LED to flicker? Its normal for the LED to flicker with normal speech 6-12" from the microphone, if you need to shout check all the soldered connections on transformers - its VERY common to not solder the wires properly. To avoid this issue its best to tin them before fitting to PCB.

There is a possibility that the inductors in the output filter have too many turns - if you have an oscilloscope can you see if you are getting the full voltage swing on the drain of the output transistor regardless of frequency? If so check the turns on the inductors.

Hope this helps,
Steve G6ALU

Topic: 2691 Message: 2692

Hello John,

I'm very much interested, but must plan carefully.

First at all I need to install my 80m portable GP with enough radials, for which I need reasonable weather, and I have the option to go to Nieuw Beerta location, FB HF location !

As back up CW would be nice, I have also T1380 Ten-Tec kit with 3W RF on CW.

I will give you heads-up when I can be QRV on 80m at midnight. ALready worked transatlantic on 40m at midnight in CW with 3W, my MKARS 80 is now a few months operational.

Please keep in touch via marcschijven@... which I check daily.

Thanks Steve. Loud but not shouting, it seems strange that on the lower part of the band it is fine but the higher I go it stops flashing and the power drops. If time allows over the wekend will check the windings. Thanks again Barrie

From: Mark
Topic: 2688 Message: 2694

Hi Barrie,

Have you tried adjusting your transmit bandpass filter, "C54, C68 and C79 band pass filter"? The manual says the settings are not critical, however your symptoms point to this being a possible cause. Personally, I would try adjusting these while on a low-output frequency and see if the power can be made to come up.

73,

Mark - N7EKU

John,
Could be but could also be a poor solder joint on one of the filter inductors or mixer transformers - the vibration of the relay throwing fixing the problem.
So check this first as removing the relay can be tricky.

Topic: 1014 Message: 2701

I am not sure exactly how this worked,but audio suddenly came alive after I tightened up the M3 nut and screw that attaches the final transistor to the case of the MKARS80 separated by the insulator.

Hi Ian, 30m (as far as I know) is for CW/digital modes only, I would say you were looking to Tx on WSPR or QRSS, Hans Summer and Steve Farthing have Tx only (no PC needed) kits for sale.

Thanks Colin. Very interesting site.

I am looking for a small SSB radio so that I can run all kinds of AFSK modes, in particular APRS. Modulation methods depend on the mode, so a dedicated mode radio (like QRSS) won't really fit the bill.

2718. Winter Build

Yahoo group: mkars80
Date: 2012-12-10 18:03:07 UTC
From: charles
Topic: 2718 Message: 2718

Hello all. started building my mkars80 this weekend; my second transceiver project this year - my bitx20a build in the late spring, early summer went very well. (first mkars80 observation: I like the parts in numbered bags) I made it through the transformers in bag 3. I'm going to finish bag three today I hope. the spacing on the board is tight but not problematic. my goal is to finish the build and have it operating before Christmas. (second mkars80 observation: the manual is very good) ... 73 de chas ai4ot

Hello Charles

First of all good luck with the build. You are correct in saying that
the manual is very good, Steve did a great job.
The really important part of the build, which I'm sure you are aware of
if you have been following the postings in the group, is to be
absolutely sure that the coil connections are good.
Most problems with the build can be traced to joints on the coil wires
because the insulation hasn't been removed sufficiently.

Have fun and I hope it goes well.

73,
John.

From: charles
Topic: 2725 Message: 2725

hello all ... it was so much fun just listening to all of the qso's on 80 meters last night that I didn't get around to wiring up a doo-dad to convert my "normal" mic connections to the mkars connections. (not a big deal because I really don't have an antenna suitable for transmitting on 80m right now ... I live in an apartment and use a base loaded whip that I extend from my window when I operate ... it loads fine on 40 and up but not on 80 ... I can listen with it however. I'll use a hamstick for 80 but I have to dig it out of storage ...) THANKS for reading because so much of the fun of this hobby is sharing the magic with others who understand. I did wire up an external speaker so I wasn't confined to headphones which I use almost exclusively with cw ... I'm taking the kit to my 2meter radio club meeting saturday and will show it off and talk about kit building in general ... I'm thinking about making a box for it from pc board because I'd like to have it slope ... anyway, enough of this prattle ... very nice kit! 73 de chas ai4ot

From: Colin
Topic: 2728 Message: 2728

Hello to the group and best wishes for 2013.

Today I took along my MKARS 80 rig with me on my New Years' Day SOTA activation of Rombalds Moor (SOTA ref G/NP-028).

I don't have a permanent antenna at my QTH, so I've haven't really tried out the MKARS 80 before. I once took the rig to a friends house but he has such high QRN that I didn't manage a contact and wasn't sure if the rig worked!

Today my CQ call was answered almost straight away and reports were very favourable. I worked a small number of stations in succession. I spoke to an amateur later on, on 2m FM, and I asked him how my MKARS QSO with him had sounded at his end, his reply was that he wasn't even aware that the rig had been home constructed, he had thought I was using commercial gear!

I noticed that the huff puff was only just holding lock, when normally at home temperatures it seems to hold very steady indeed. I think the huff puff circuit is a great asset, especially for portable ops -I think I would have been a bit drifty this morning without it!

Today's photo -
http://www.flickr.com/photos/24901892@N03/8332879659/

Great kit Steve!

Happy New Year!

Hello to the list.

I started the kit DIGITAL SWR METER this afternoon. It a pleasure with the nice wx!
I have a problem with L1 and L2.
It's resistors 100 ohms not selfs???. I think you use selfic effect of the resistor??? If I am wrong may you tell me. I will sold but I wait.

I try to read the pdf, perhaps I have a problem to translate ;-)

All the best and happy new year!

2732. Re: [mkars80] digital swr meter kit

Yahoo group: mkars80
Date: 2013-01-09 17:50:19 UTC
From: John
Topic: 2651 Message: 2732

Hi Philippe

On page 4 of the V1.1 instructions it says 'Positions L1 and L2 have resistors fitted'.
In the 100 ohm list under that the last 2 are L1 & L2 so just fit the resistors and ignore the fact that they are labelled as inductors.

I made this kit quite a while ago and it's very good. I separated mine into two parts because I didn't have a suitable box.
The difficulty is that the switches are in a very strange position so I altered mine by changing the position of the display which puts the switches on the back.

I wish you every success.

73,
John.

That's correct, we found the inductors weren't required so have used resistors to replace them.

Hi Philippe

On page 4 of the V1.1 instructions it says 'Positions L1 and L2 have resistors fitted'.
In the 100 ohm list under that the last 2 are L1 & L2 so just fit the resistors and ignore the fact that they are labelled as inductors.

I made this kit quite a while ago and it's very good. I separated mine into two parts because I didn't have a suitable box.
The difficulty is that the switches are in a very strange position so I altered mine by changing the position of the display which puts the switches on the back.

I wish you every success.

Hi John, nothing heard tonight, are you sure about the time? looking at the Newfoundland and Labrador Evening Traffic Net webpage the time Nov-Mar is 21:30 UTC and May-Oct 22:30 UTC.

I will listen out again tomorrow night at 21:30 and 22:30 UTC.

2738. Problem with digital SWR meter kit

Yahoo group: mkars80
Date: 2013-01-17 22:49:23 UTC
From: spam_balti
Topic: 2738 Message: 2738

Hi

After building the SWR meter I used a Baofeng UV5R and a 50 ohm dummy load to test it on 145.550Mhz. This showed 4W forward power and an SWR of around 1.05:1. I realise the detector board is designed for HF, but I thought I would try a VHF radio as I don't have a HF rig as yet.

Then I put the two boards into the case and noticed the FWD power was now 0W, and the REV power was about 2W, so half the power, in the reverse direction, and the unit would no longer switch on automatically. To get the meter to switch on automatically I had to switch around the dummy load resistor and the RG58 cable.

I took the case apart and had a look at the boards. It appeared as if there might be a short between the GND wire and and an adjacent pin (FWD power?) on the detector PCB (caused by the ground wire being bent to one side). I shortened the exposed wire on the ground lead and resoldered it to the dectector PCB. Once again everything seemed to work fine, showing 4W forward power and an SWR of around 1.05:1.

After putting it back into the case the same symptoms reappeared, 0W FWD power, 2W REV. After removing the boards from the case I could no longer get 4W FWD + 1.05 SWR to appear on the LCD.

I looked through the fault finding section in the manual and measured all the voltages listed on the main PCB. These were measured while using a 13.8V nominal (14V measured), 1.5A PSU:

Q1 voltages were marginally higher than specified, presumably due to the 14V PSU:

Q1 (BC327)
Emitter 13.3V rather than 13V
Base 12.5V rather than 12.3V
Collector 13.3V rather than 13V

There was a discrepancy for the Q2 transistor (BC547), but this seems to be the driver for the piezo transducer, which I have not yet connected, so I assume this is unimportant:
Q2 (BC547)
Emitter 0V
Base 0V
Collector 0.75V rather than 5V

Pin 16 on the PIC showed a constantly changing voltage whenever the meter was in the default display mode, i.e. showing SWR/FWD power/REV power/batt voltage. When in any other display mode this pin is steady at 5V.

Based on this, I am assuming the problem lies on the detector board.

I can't measure any short between the GND, FWD or REV pads.
The two 10nF caps show as 11nF and 13nF measured in-situ.

The two diodes show forward voltage drops of 0.256V and 0.257V, no reverse flow.
The TRX and ANT ports have a resistance of 0.3 ohms between signal and ground, this seems too low, but I notice from the circuit diagram that the inbound TRX signal is connected to ground via T2.

Does anyone have any suggestions of measurements I could make on the detector board (or main board). I have a small DDS signal generator that can output from 0-5Mhz at around 3.75V rms, as well as a multimeter, a 4W HT and 50 ohm dummy load. I have a scope buried at the back of my garage, so I could also fish that out. I should also have a proper function generator in the garage.

I'm a beginner in radio/electronics, so I'm guessing it is an error on my part, maybe I have damaged something through excessive use of soldering iron (I was using unleaded solder for the first time).

Any suggestions gratefully accepted.

Thanks

John

John, it appears to bean intermittent problem most likely on the detector board, check that the enameled wire is soldered ok and that the copper has "tinned".
When transmitting into the SWR meter do you measure much on fwd and rev connections? You can check correct operation of the micro board by connecting Tp3v9 to fwd and rev....you should get a reading of 21 W if I remember right...its in the manual.

2740. Re: Problem with digital SWR meter kit

Yahoo group: mkars80
Date: 2013-01-19 22:28:26 UTC
From: spam_balti
Topic: 2738 Message: 2740

Hi Steve

Thanks for the reply.

The enameled leads had been sanded and tinned, and so I tried resoldering them all as per your suggestion, and this appears to have fixed the problem on the detector board. I measured 2V FWD and 0.1V REV on the pads when keying the 4W HT into a 50 ohm dummy load. I originally had an approx. SWR of 1.05:1, so this looks correct.

On the main PCB, after calibration using TP3V9, I originally had 23.1W showing on the LCD for forward and reverse power with the FWD & REV input pads both connected to TP3V9. Unfortunately I think I have managed to break something with my prodding. At one point to test having different voltages applied to the main PCB FWD and REV pads, I sent the board Vcc (14V) to FWD, and TP3V9 (3.9V) to REV. This registered ~120W forward power on the LCD, but possibly this resulted in a fried U1 (Tl431CLP) and U3 (LM358AN). There are now 3 incorrect voltages on the PIC, but from looking at the source code, these are all programmed as input pins, so nothing wrong with the uC itself:

pin 17 RA0 shows 0.7V instead of 1.3V
pin 18 RA1 shows 0.7V instead of 1.3V
pin 1 RA2 is correct.
pin 2 RA3 showing 1.8V instead of 3.9V (TP3V9 ref voltage)

Pin 2/RA3 is driven from U1 (TL431CLP). I tried resoldering U1, and its neighbours R10, R14 and R15, but this made no difference, so possibly I have broken U1. It's pin voltages are 1.8V, 0V and 1.1V. I have ordered a replacement, so will try substituting this when it arrives.

Pins 17/18/RA0/RA1 are fed via U3 (LM358AN). The Vcc (13.2V) and GND are the only correct voltages on this IC, everything else is approx. one half of the correct values, so I have also ordered a replacement to try. I used a DIL socket for this, so it will be quick to swap out.

I've noticed I seem to have a TL431CTI, but the user instructions list a TL431CLP (which is what I ordered). I'm assuming the CLP version will work just as well as the CTI version. Let me know if this is not the case.

2741. Tuning 3.5 to 4.0 MHz with the MKARS80

Yahoo group: mkars80
Date: 2013-01-22 15:49:35 UTC
From: k1trb
Topic: 2741 Message: 2741

Hi

The following mods are easily reversible and address the US 80m band with the MKARS80.

The rig is designed to tune 300KHz. I could move mine up to about 3.94MHz but not higher. So here are some simple reversible mods. The capacitors should be C0G (NP0) small ceramics.

1. Reaching 4.0MHz.

Use a 10pF ceramic disk. On the back side of the MKARS80 board, tack this capacitor across either C45 or C38. Use short leads and trim off the excess.

Now C38 will trim the band to 4.0MHz. But it will still only be 300KHz wide.

2. Getting the full 500KHz.

Use a 33pf disk or 0802 smd ceramic capacitor. On the back side of the board, tack this capacitor across C47. Now the frequency span should be about 500KHz. Use C38 to put this band in the right place: 3.5-4.0MHz.

Use short leads and trim off the excess if a disk is used. An 0802 smd part will just fit.

By the way, does anyone know how I can change my login on yahoo from w0lwa to k1trb without creating a new login?

2742. Horrible Varactor VFO Buzz

Yahoo group: mkars80
Date: 2013-01-22 16:54:17 UTC
From: k1trb
Topic: 2742 Message: 2742

I need advice.

In implementing the varactor vfo tuning mod my vfo has a
terrible buzz. (I use a bb112.)

This vfo is a bjt series tuned Colpitts. I also built
a 40m Hartley fet vfo straight out of emrfd which I tried to
tune with a power diode used as a varactor. It too buzzes.

I have successfully added very small trim capacitors (like the
bandspread and Huff & Puff stabilizers on the MKARS80) to
vfo's. But my "broadband" tuning efforts have been
buzzing busts.

If I trade the varactor for a capacitor, the vfo sounds
just fine.

==> Some theory:

1. Diode rectification.

The PTP voltage on a vfo inductor can be quite large.
This voltage adds to the dc tuning voltage of the varactor.
Thus, the voltage on the varactor can go negative during
the cycle so the diode will rectify.

This issue is discussed on the web (e.g. on qrpops).

2. Phase modulation

I cannot find this issue mentioned or discussed on the web.

The actual voltage on the varactor is the sum of the rf plus
the dc tuning voltage. Thus the junction capacitance of the
varactor will go up and down right along with the generated
sine wave.

If the rf voltage is very small (as in a varactor trimmer
or a receiving rf preamp) this effect should be of no
consequence.

But for broadband tuning of a vfo it might be an issue.

The capacitance does not respond immediately, so there is
a phase delay. Further, the phase effect is limited.
For example (math geek stuff) it might look like:

A sin(w t + B sin(w t + c))

The second term is the varying phase shift. By changing
B and c it is possible to make this wave look like the
one I see on my oscilloscope at the vfo test point.

But I have no idea how this wave results in a buzz around
100Hz.

==> Some practice.

My circuit is a capacity Ct connected from the C45 - L5 junction
to the varactor Cv which then connects to ground.

The varactor Cv is biased from the 8v regulated supply
shunted by .1uF through an impedance Z. (The voltage is
set by a resistive divider and a 10 turn pot.)

I have tried large (470pF) Ct which needs high DC on the
varactor leading to low Cv.

I have tried small (82pF) Ct which needs low DC on the
varactor leading to high Cv.

I have tried resistors for Z (ranging from 1K to 1M).
I have tried inductors for Z (ranging from 150mh to 300uH).
(The 300uH inductor turned the vfo into a 470KHz oscillator!
But the 300uH Z did have very high impedance at 6MHz.)

I tried different bb112's.

They all buzz.

None of these changes alter the buzzing frequency enough to
be noticeable. So the changing parts are not part of determining
the buzz frequency or amplitude.

If I replace the bb112 by the polyvaricon, the vfo works nicely.

(This buzz can be heard on my Icom 718
at the appropriate 6+ MHz frequency of the vfo. It also
causes MKARS80 signals to hopelessly gargle. With a
1KHz band limit on my scope I can see an am modulation
envelope at the vfo test point of about the right frequency.)

==> An Aside:

I have no idea why a 68mH choke works for PA0RCL. My VNA shows
these chokes to have low impedance at 6MHz.

The self resonant frequency of a 68mH choke (according to data
sheets) is about 80KHz. About 80KHz the reactance goes capacitive
for a bit. But at higher f, Z is a lottery. At higher frequencies
the ferrite is changing properties rapidly with increasing frequency
and probably is about like air at 6MHz.

So, why does this work for him?

Yeah. I need help.

thanks
tom

2743. Mixer mods

Yahoo group: mkars80
Date: 2013-01-22 17:01:08 UTC
From: k1trb
Topic: 2743 Message: 2743

Here are two mods I did that might improve performance.

Easy route:

Using methods described in the ARRL Handbook, match
4 diodes from the total batch. Then match 2 diodes
from the batch.

Use these matched diodes in the two mixers.

Harder route:

Use matched 1N5179 Schottky diodes in the two mixers.

Matching diodes should improve mixer balance. Using
Schottky diodes should lower the noise level and make
the receiver more sensitive.

I haven't measured the results of these mods. They are
just sensible.

From: Ken Greenough
Topic: 2742 Message: 2744

Hello Tom,
The RF from the osc' could be getting back
through the supply leads into your PSU and
the PSU diodes mixing it with your AC supply
frequency [a problem often noticed on DC
receivers]. Have you tried a battery supply as
a quick check ? . Regarding the VFO RF being
rectified by the varicap.. a dual diode can solve this
problem, remembering to provide a DC path for both
diodes.

OK Tom, might be a daft question, how long is the wire from the variable resistor to the varicap? If it is more tham 1 inch then you need screened leads feeding the 8v to the v resistor and from the wiper, otherwise anything picked up on the wiring will affect the tuning volts. I used 2x MVAM109 back to back, this removes the effects of RF volts on the doides. I use a 470Kohm between the v resistor and the diode cathode junctions.

73 Mike.

2746. Crystal Oscillator conflict

Yahoo group: mkars80
Date: 2013-01-22 17:27:47 UTC
From: k1trb
Topic: 2746 Message: 2746

The BFO (10MHz oscillator) performs two conflicting jobs.

1. Set the frequency standard for the frequency display.
2. Set the injection frequency of the carrier on the
crystal filter passband.

Crystal filters are sensitive to crystal parameters and to
the value of coupling capacitors. The crystals and capacitors
supplied in the MKARS80 are standard values and thus have
variations in exact value.

Go on the web and listen to various MKARS80 videos. You will
hear a variation in the audio response. This is because each
MKARS80 has it's own unique crystal filter characteristic and
all BFO's are set at 10MHz.

This can be improved by positioning the BFO at a "good point"
on the crystal filter slope. But then, of course, the frequency
readout will be wrong (but you'll sound better).

==> optional difficult improvement

I modeled the filter and did not like what I saw. The passband
is too narrow and it is a hump. So I measured my crystals,
used the lowest Q crystal in the BFO, and redesigned the filter.
Since each filter is uniquely determined by the crystals used,
my values are not important. Wes Hayward w7zoi explains design
in QST and QEX articles and in emrfd.

When the BFO is correctly set on the passband of the filter
it is no longer right on 10MHz. It's probably low. It is
possible to move the filter up by tuning it, but not worth the
effort.

==> An easy improvement

Now you can improve your audio by setting the BFO at the right
injection point of the filter characteristic. Have a friend
listen to you while you talk and adjust the BFO frequency.
Or you might try just listening, tweaking the BFO, and retuning ssb
conversations to get the best audio.

Ideally, 300Hz should be about 6db down. With the MKARS80
passband this is probably not acceptable, so "setting by
listening" will work best.

When you're finished, your frequency display will be off a little
bit. You can live with this knowing the amount of error, or

you can reprogram the PIC to give the correct value. The reprogramming would just add or subtract a few nops in the frequency counting code loop of the PIC.

regards
tom

From: k1trb
Topic: 2742 Message: 2747

Thanks Ken

The Z plus .1uf filter to the varactor has very
short leads. The MKARS80 is run from a 12v battery.
The dc feed to the varactor filter has been modified
and measured in many configurations. I can find
no rf on this lead and varying things makes no
difference. I've tried additional filtering and
shielding on the dc lead. No difference.

This buzz also is present in an entirely different
vfo layout and design.

Amazingly, in both designs the buzz frequency is about
the same.

I seem to be snakebit.

thanks
tom

2748. Re: Horrible Varactor VFO Buzz

Yahoo group: mkars80
Date: 2013-01-22 17:49:18 UTC
From: k1trb
Topic: 2742 Message: 2748

Thanks Mike

The MKARS80 is run from a 12v battery. I have varied
the dc feed in every way I know how including additional
bypassing. I can measure no rf on this lead. Moving
it all around makes no difference.

I have not tried back to back diodes yet. This approach
is supposed to address the diode rectification issue.
It is worth a try since the phase modulation issue might
be addressed somewhat. At least it will determine if
phase modulation is causing the problem.

(Since the capacitance change follows an exponential
voltage curve, the "compensating change" of one diode
is not the opposite of the "change" on the other diode.
But there is some cancellation.)

thanks
tom

Tom,

Not sure whats happening here but if you can see a strange waveform on
the scope are you sure the oscillator isn't "squegging"?

From: Steve Drury
Topic: 2743 Message: 2750

Tom,

Not sure its worth while changing the diodes for a different type, it
may reduce the loss but this isn't a problem on 80M - all diodes come
from the same reel so they are reasonably well matched to start with but
won't casue any problems if you want to test and sort them for the best
match.

2751. Re: [mkars80] Crystal Oscillator conflict

Yahoo group: mkars80
Date: 2013-01-22 21:10:58 UTC
From: Steve Drury
Topic: 2746 Message: 2751

Tom,

I don't believe the two jobs are conflicting, why have two oscillators when one will do? Remember that the MKARS80 is a single board design with no interstage screening, if you have another oscilator for the frequency counter not only do you have additional cost but also very likely introduce "birdies" somewhere in band also another trimmer to adjust.

You have optimised the crystal filter for receive, have you had any QSOs in this state? You may find your transmission muffled; with the BITEX based transceiver the impedance seen by the filter changes between transmit and receive so the filter design is a compromise solution.

In the last 4 years about 1500 MKARS80 have been sold, I guess about 2/3 have been on the air mainly with good reports... the MKARS80 was designed as easy to build and low cost transceiver making changes like matched crystals, multiple oscillators and varicap tuning would have defeated the design objective.

I ask everyone to build the radio as intended BEFORE making any changes then they know at least it worked OK in the first place! Then go ahead and make changes (improvements?), that's the way you learn.

If you want to modify the firmware the code is on my website, I know that some folk enjoy personalising their radio with a callsign or different display format.

Have fun,

Steve G6ALU

From: k1trb
Topic: 2742 Message: 2752

Steve

Thanks for your comment.

After Ken and Mike's replies it dawned on me that the
oscillator might be squegging. If so, I can't seem to
find a scope setting to show me this. It certainly
sounds like squegging. The MKARS80 audio sounds like it is
gated at 30 to 60Hz. I'm not sure I know how to trigger
my scope to see it. Would a diode probe show it?

I don't know what timing cicuits might allow this.
Squegging is supposed to be caused when two timing
circuits are very close. (Two bypass loops resonant
at frequencies differing at the squegging rate.)

Leads around the varactor are very short. Putting
the polyvaricon in place of the varactor solves the
problem. (No other changes.)

Just now I put the varactor on a separate battery and
that makes no difference.

The squegging frequency is not affected by:
1. the dc bias circuit to the varactor.
2. the blocking capacitor to the varactor.
3. the voltage on the varactor diode.

Hmmm.

This is worth tracking down since, as I said, it happens
in a vfo of completely different design.

I thought squegging was from the age of vacuum tubes.

thanks
tom

Steve

Thanks for your comments.

I figured it wouldn't make a lot of difference, but it was
an easy mod and allowed me to test out some new diode
matching techniques I've evolved.

I'm not sure I agree on matching the 1N4148's. Even
with diodes from the same batch, they checked out with
noticeable differences. Matching will improve balance
in the mixers.

thanks
tom
.

Tom,

I'm interested in learning about diode matching techniques. Do you have an online reference for a newbie? I saw the handbook referenced, but I suspect that may be the RSGB handbook which I don't have.

Steve

Thanks for your comments.

I view what I am doing as tweaks. I certainly would not
recommend changing your design.

As "design under constraint" the MKARS80 is an engineering
marvel.

Yes, I have had before and after qso's on my filter mod.
The before mod received comments about "pinched audio"
(heavy on the highs). The after mod were comments on
how nice it sounded.

My mods cannot possibly be recommended for the kit you
supply.

Resetting the BFO really requires recoding the PIC.
(Something I am doing and will eventually complete.)
In my opinion, it is just plain unwise to sell a kit
that requires recoding a PIC.

The redesign of the crystal filter is way beyond what
should be expected.

I'm just having fun and telling other people who can do
this about it.

thanks
tom
.

Squegging can be caused by too much positive feedback, try increasing the value of the bottom end capacitor - that's in a Colpits circuit.

Steve

Steve

Thanks for your comment.

After Ken and Mike's replies it dawned on me that the oscillator might be squegging. If so, I can't seem to find a scope setting to show me this. It certainly sounds like squegging. The MKARS80 audio sounds like it is gated at 30 to 60Hz. I'm not sure I know how to trigger my scope to see it. Would a diode probe show it?

I don't know what timing cicuits might allow this. Squegging is supposed to be caused when two timing circuits are very close. (Two bypass loops resonant at frequencies differing at the squegging rate.)

Leads around the varactor are very short. Putting the polyvaricon in place of the varactor solves the problem. (No other changes.)

Just now I put the varactor on a separate battery and that makes no difference.

The squegging frequency is not affected by:
1. the dc bias circuit to the varactor.
2. the blocking capacitor to the varactor.
3. the voltage on the varactor diode.

Hmmm.

This is worth tracking down since, as I said, it happens in a vfo of completely different design.

I thought squegging was from the age of vacuum tubes.

thanks
tom

Tom,

I'm not sure of your angle but I wouldn't expect anyone to recode the
PIC but the code is there if they want to play...

It would be nice to have specially made crystals like Elecraft use but
then you would be paying Elecraft prices for the kit!

John

Enter the following line into google search:

"diode matching for mixers" qrppops

This is a fantastic website with a large number
of very practical homebrew circuits. He wants to
keep the exposition straightforward so that the
technical engineering is all behind the scene.

I thought matching was covered in the ARRL Handbook.
If so, it's not in the index of my 2005 edition.

I know Lew McCoy talks about it in old QST articles, but
a search of past QST's doesn't turn it up easily.

People now use "off the shelf" double balanced mixers
which have matches we cannot achieve. So maybe
matching is a lost art.

Have fun.

regards
tom
.

Steve

Thanks for the help. I'll try that.

I'm not exactly sure why the switch from varactor to polyvaricon
would make a difference ... but it does.

If it is feedback, then I can solve my problems in other vfos
too.

thanks
tom

Steve

You are exactly right (and I said so in my post).

Crystals like in the Elecraft are like adding off the shelf mixers
to the MKARS80. They break the price point and defeat a
major point of the project.

There are two reasons I got a MKARS80:
1. I am designing a 20m personal mobile.
2. The MKARS80 is a great project and I thought it would
be nice if my club made it.

#1 The MKARS80 allows me to test out ideas for my PM
in a completed working rig.
For example: my PM will be controlled by a PIC and have a
Huff&Puff vfo. I can just code a PIC 16F818 and try out
my code on the MKARS80. In fact, analyzing your code
was where I began. It was great of you to put it out
there.
#2 Unfortunately, the MKARS80 is far too challenging for
my club. But it was a good idea. And I'm having fun.

thanks
tom
.

Hi Jes,

That's a very large tuning range so looks like you have a couple of capacitors the wrong way round in the VFO... check carefully. If you have a frequency counter can you measure the frequency at TPVFO?

Hi Steve

A very wide ranging piece of junk because it just turned up in the penturning group with a slightly different code at the end and a different sender!

Hope you are well.

Regards,
John.

Steve...I found an unwanted solder bridge within the vfo which on removing put the range where it should be.I have adjusted C38 and my tuning range is now 3.460 - 3.888 MHz.I found a strong cw signal on another rx and can hear it VERY faintly on the Mkars with the rf gain on full....Jes

I wonder if this is another poor joint around the CFO section. The huff and puff won't lock if it is drifting fast as it thinks you are tuning.

Hello Jez,
I am not sure how you had a successful QSO without the huff and puff locking.
Mine won't lock without drifting unless I first have a warm up period of at least
15 mins. Have you tried a prolonged warm-up?
John, vo1jcc.

When turning on the radio everything works as it should.It would seem that once it has warmed up it drifts and wiil not lock.That sounds like a dry joint does`nt it? once it has warmed up the U displays continually,occasionally flashing the + symbol...Jes

OK Jes, sounds like a duff component somewhere. The most likely culprit
is one on the feedback capacitors C59 and C60, send me your address by
private email and I will pop a couple in the post.

Steve

Hi Tony,
The micro isn't seeing any VFO, check the soldering on the VFO coil then voltages on VFO transistor and buffer stages.

Hi Steve,
Thanks for the help, you were spot on, dry joint on VFO coil.Now tunes to full frequency range and picked up some stations. I am so impressed with the quality of this kit and your support, have purchased the SWR meter from you and looking forward to that when I have completed this build.
Many Thanks
Tony

Hi,
Have you adjusted the range trimmer as in the instructions? The kit must be set up by following the instructions first.

Regards,
Steve G6ALU

I've just finished building the radio, done the initial testing, then connected the display, first problem I had was that I didn't get any frequency digits on the display, this was due to a cold joint which I fixed and problem solved, now my main problem is that the frequency range is between 3.964 and 4.340, couldn't find anything that was solve the problem, I was wondering if anyone had any suggestions to solve it, thanks for the help.

2798. rodger the bodger's mkars

Yahoo group: mkars80
Date: 2013-04-21 09:25:31 UTC
From: christopher_iles@btinternet.com
Topic: 2798 Message: 2798

Hello All,

I was the (fortunate?) winner of a bodged mkars80 on eBay. The power wires had been put in the wrong way round and when the fuse blew, "Rodger" shorted the fuse out with a nice thick piece of wire and re-connected it...the wrong way round again, oops!

Cutting a long story short and many BC547s aswell, I now have a working receiver and lcd. The huff and puff seems to be doing it's job but the receiver seems quite deaf.

I tried connecting the aerial after the low pass filter in case there was a problem with that but no difference.

I am hearing fellow amateurs on the radio but from reading the excellent reports about the receiver I think mine's a bit deaf as I can only get reasonable results using a half wave inverted vee at 25 feet.

The transistors I have used are BC547Bs (bought brand new). There were also a couple of MPSH10s (or something like that!) which I also replaced.

Not fired up the transmitter yet and the metal case...that's another story ha ha! I think the holes were made with a knife and fork!

If I get this radio as it should be I will call it the MKARS80 SP-FASE...silk purse from a sow's ear!!!

Any advice or assistance as to how lively the rx should be would be welcome.

Thanks, Chris. G0VOE in Somerset.

Subject: [GQRP] Does anyone fancy a paid puzzle?

I have a ten-tec QRP rig, mono band that does not work *no RX, and I've not tried TX) and need rebuilding. Is there anyone who might be interested for a modest fee?

it's the 15m version of this:-

http://www.tentec.com/products/20-Meter-QRP-Transceiver-Kit-%252d-Model-1320.html

There is muffle audio, but not what it should sound like,,, and no signals at all.

Regards

Stephen G7VFY

07956-544202

Good luck with your quest to repair this excellent radio, I own one and I DO apreciate!
Unfortunately for you, einstein.186 aka mister35mm is a pro ebay shill bidder and that cost you 37 quid for the rig itself.
Thank God Steve is around to lent a technical hand!!!
All the best!

Hi Chris, first check to see if Roger has soldered all the wires from mixer transformers properly, it's common for the enamel to remain on the wire and insulate the joint....if these are Ok check voltages before going further.

Hi,

As both 8 MHz and 10 MHz are high side mix, you will still end up with LSB, looking at the circuit double sideband is generated the filter will reduce the bandwidth to 3Khz, and the sideband you get will depends on the frequency of the reference oscillator, whether it is below or above the filter frequency. The sideband could them be inverted depending on the VFO frequency later on.

I am sure Steve is better placed to explain, I have not seen a block diagram.

A four pole ladder filter with shunt capacitors doesn't have an optimum stopband for USB use. You either need more poles or change it to so the crystals are shunt with capacitive coupling. Sorry but as the market is limited I won't be taking it further, more important is a radio for 20 and 40M. Malcolm, Yes I have been for some time, problem is though trying to satisfy every ones wishes! I know there are many who won't attempt SMT (surface mount technology) but I, and probably many others have been pleasently suprised at how few issues there have been with the Hunter SDR construction, several first time SMT constructors have demonstrated that its within their grasp. Through hole component availabilty is getting poor - this technology isn't in widespread use any more. Here are some questions that I've been asking myself; 1. Single band or multi-band? If multi how many bands. 2. Conventional, SMT or a mix of both? Modern DDS and VFO chips (Si570) are only available in SMT. 3. Conventional superhet or SDR? SDR will require SMT to do a decent job. 4. What sort of VFO? LC, DDS, Si570... 5. Output power? QRP is <5W but 10-20W is more useful. 6. What cost model? Low cost like the MKARS80 or a premium product? Several ideas are spawned by these questions; 1. A QRP transceiver which can be built for any band, say up to 18MHz. Fixed side-band ("normal" for the chosen band), CW and SSB, audio derived AGC, simple VFO, internal speaker and space for internal batteries and through hole construction.This would probably cost 50% more than the MKARS80. 2. A QRP transceiver with a few bands of constructors choice, up to 30MHz. Higher output power ~10W, CW and LSB / USB, DDS or Si570 tuned (Si570 preffered). Audio derived AGC, internal speaker and space for internal batteries. Would probably need to be in SMT.... Those are my ideas but can't promiss anything will come of it. As a feedback Steve, I would like a multiband transceiver say 20, 30, 40 metres CW/SSB or CW only - built in keyer option - surface mount no problem - not needing a computer to use it - part populated board available if required - power switchable up to 10 watts - digital vfo if noise is acceptable - built in loudspeaker - internal space for batteries and antenna tuner (not necessarily auto - a readily available case to fit it all in - digital display.

Will this do for now?

Topic: 2802 Message: 2811

Hi, I would just like to add my voice that the hunter was a dream to build and worked from switch on, I use 3.5X and 4X reading glasses to mount the SM components and a fine temp controlled soldering iron. 73, I look forward to more products. From: mkars80@... [mailto:mkars80@...] On Behalf Of steve@... Sent: Wednesday, April 24, 2013 2:05 PM To: mkars80@... Subject: Re: [mkars80] Re: MKARS80 on 5MHz? Malcolm, Yes I have been for some time, problem is though trying to satisfy every ones wishes! I know there are many who won't attempt SMT (surface mount technology) but I, and probably many others have been pleasently suprised at how few issues there have been with the Hunter SDR construction, several first time SMT constructors have demonstrated that its within their grasp. Through hole component availabilty is getting poor - this technology isn't in widespread use any more. Here are some questions that I've been asking myself; 1. Single band or multi-band? If multi how many bands. 2. Conventional, SMT or a mix of both? Modern DDS and VFO chips (Si570) are only available in SMT. 3. Conventional superhet or SDR? SDR will require SMT to do a decent job. 4. What sort of VFO? LC, DDS, Si570... 5. Output power? QRP is <5W but 10-20W is more useful. 6. What cost model? Low cost like the MKARS80 or a premium product? Several ideas are spawned by these questions; 1. A QRP transceiver which can be built for any band, say up to 18MHz. Fixed side-band ("normal" for the chosen band), CW and SSB, audio derived AGC, simple VFO, internal speaker and space for internal batteries and through hole construction.This would probably cost 50% more than the MKARS80. 2. A QRP transceiver with a few bands of constructors choice, up to 30MHz. Higher output power ~10W, CW and LSB / USB, DDS or Si570 tuned (Si570 preffered). Audio derived AGC, internal speaker and space for internal batteries. Would probably need to be in SMT.... Those are my ideas but can't promiss anything will come of it. Stuart,

How much would you be wiling to pay? Thinking on using an Si570 for flexibility but they aren't cheap... cheap DDS won't go very high in frequency and also worried about spurs.

Topic: 2802 Message: 2813

Hi Steve

I'm fine with John's input except:

1, CW only: there are many other CW only products (kits), so SSB + CW would do it for me.
2, Partial population (SMT) if possible sounds like a good option, but I'm going to take the Hunter SDR plunge soon to gain experience.
3, Pricing: if the kit was around £100ish that would be good.

The MKARS has a very good brand in the market and I have seen many people talk about a 40/20m variant. A proper kit would probably sell well leveraging the MKAR80 experience.

That's my tupppence worth.

£100 ish and if the phase noise is acceptable go with the Si570 - plug in modular construction would allow for blanking plugs and later extension of facilities - some people have small electronic keyer modules already etc. In short maybe a development kit with an overall vision and ability to purchase addons as money is available.

I have an mkars80 with cw option and it pleases me.

Hi Stuart,

I've thought about modular construction before but it has its problems - if the PCBs are hard wired the radio performance is beyond my control, really depends how the constructor packages it. Each module means a separate PCB to tool and purchase, this would add to costs considerably. If its a motherboard daughterboard design the they will all need screening... adjacent vertical PCBs tend to couple into each other.

You can see I don't like multi-PCB designs!

Topic: 2802 Message: 2816

Hi Steve,
My vote would be for
Both SSB and CW.
Multi band, choice of, say, three from 40 to 10.My choice would be 30, 17, 24. We are licensed in South Africa to use 30 for SSB during daylight hours.
Mix of both SMT and TH. I found SMT quite straight forward, you've just got to bite the bullet! You must also have the right tools and thin solder with silver. Lots of light.
Conventional Superhet.
VFO Si750, LCD readout etc.
AGC audio derived.
Output 10 - 20 W
Premium product with sensitive, stable receiver.
Complete kit with case etc.
Price 150 to 200 Pounds.

I would also be interested in a 40 and 20 version of the MKARS80.
Looks like you are going to be busy!

Thanks for your input Norman, I've changed the thread name to something more appropriate..

I don't think 20W is very practical when running from internal batteries, I was thinking of 8 - 10 AA sized NiMh. The highest capacity appear to be 2850mAh although I don't know if that's achievable in practice.

From: Mark
Topic: 2802 Message: 2818

Hi Steve,

*As much SMT as possible -- after much construction involving both, SMT is far superior and my assembly time is at least 1/3 less with SMT parts. Yes just use something like 4-5X reading glasses and fine solder/fine tip. No silly lead forming, stuffing, clipping, etc yea!

* CW + SSB would be great.

* 10W CW using push-pull as it's more efficient I think than single-ended.

* No internal speaker please -- if it's big enough to sound good then it takes too much space, if it's small to save space it sounds chintzy.

* A choice of two bands if it's a good savings over three, otherwise three bands.

* Internal batteries I'm not sure, there are very good Li-Ion packs around too or some may already have gel cells...

* Price around $200 if possible? Does the SIS make the band-choice options a lot easier to implement? If so then maybe the price has to go higher?

Thank you Steve,

73,

Mark/n7eku

Hi Mark,
I've made some comments below...

On 26/04/2013 14:16, Mark wrote:
> Hi Steve,
>
> *As much SMT as possible -- after much construction involving both, SMT is far superior and my assembly time is at least 1/3 less with SMT parts. Yes just use something like 4-5X reading glasses and fine solder/fine tip. No silly lead forming, stuffing, clipping, etc yea!
I agree - as long as the parts are a reasonable size.
>
> * CW + SSB would be great.
I think CW is a necesssity now.
>
> * 10W CW using push-pull as it's more efficient I think than single-ended.
Not sure if its more efficient but it does allow for a less effective
LPF as the second harmonic is much reduced with a balanced output down
side is its more expensive.
>
> * No internal speaker please -- if it's big enough to sound good then it takes too much space, if it's small to save space it sounds chintzy.
Tough, I want one! I want a station in a box; plug in an aerial and off
you go. There wouldn't be a need for you to fit speaker or batter, its
your choice.
>
> * A choice of two bands if it's a good savings over three, otherwise three bands.
>
> * Internal batteries I'm not sure, there are very good Li-Ion packs around too or some may already have gel cells...
I've got a cheap high power LiPo pack - written on it is /"Always charge
on a concrete surface where there are no flamable objects within 10 feet
of the charging area."/ That worried me a little!
>
> * Price around $200 if possible? Does the SIS make the band-choice options a lot easier to implement? If so then maybe the price has to go higher?
>
>
Not sure of the price yet, I need to get a lot further before I have an
idea...

Hi Steve,

Yes for sure in the SMD size. I always try to buy in the 1206 to 0805 size ranges.

Yeah I wasn't sure on efficiency, but for sure better harmonics control. The IRF510's are pretty cheap, but I guess there would be a need for an extra core for the supply choke.

Would it be tough to make the CW real carrier wave (not audio injection on SSB) on a combined SSB/CW rig?

For the speaker, the boss always wins hihi! My hearing is just not so great so I tend to always have headphones around.

Yes even big bad Boeing has trouble with Li fires. Their new Dreamliner battery box is bomb proof/fire proof with titanium tubed venting to the exterior of the plane! On second thought, maybe HiMH are better!!!

73,

Mark.

Hi Phillip,

Thanks for the tip, I'll take a look. As I say the receiver is working but needs a really good aerial and should be a lot more sensitive. I've rewound the mixer transformers and checked the low pass filter for errors. Also checked all soldered joints and looked for shorts, broken tracks etc.

I'm certain I will get it going properly!

Regards, Chris. G0VOE.

Mark,
Not sure how IRF510s will perform at 10M as their input capacitance isquite high, would probably require either an extra stage of gain or useof RD16HHF1s.
Would be proper carrier CW probably from a separate carrier oscillator so I don't have to pull the BFO crystal.
Steve

Hi Peter,

I have to say I have been blessed with good vision and steady hands, and do fine work for a living so SMT seems easier to me than for others.

Have you tried soldering the very biggest size SMT devices? The bodies and pads where you solder these are about the same size as a 1n4148 diode and it's typical solder pad.

Maybe if the design could only use the biggest SMT parts, then it could be do-able by more builders?

Use of SMT is going to be inevitable due to component availability, my main (low cost) supplier has just made a through hole 1nF obsolete!
If you look at the care (eyesight) required to solder the MKARS80 it isn't much different to 0805 components. Using 1206 parts is difficult due to limited availability on some values.

Hi Mark

I used to be able to easily solder SMT until about 2 years ago - using Optivisor type equipment - but my eyesight is starting to fade and it now takes me much longer - still I guess if the only way to get decent performance is by using SMD then do be it, perhaps SMD where necessary, but THP otherwise ?

I have the advantage of being young enough to remember learning to solder through-hole. I would argue that the majority of surface mount soldering is not much more difficult than through-hole, it just seems very difficult because it is different. Doing surface mount soldering feels similar to when I watch people learning to do through-hole soldering for the first time. It's not going to be easy at first, but with practice and someone to show you techniques, you can learn.

I would love new radio kits which use surface mount components to offer new features and greater performance than would be possible in a purely through-hole kit.

Well me too :-) I was taught by a friendly volunteer to help me get my Webalos electronics merit badge!

I would argue that the majority of surface mount soldering

I had trouble at first for sure, but you learn things to make it easy as you practice... High mag reading glasses and good serrated tweezers (and some practice) helped a lot. I saw another fellow on the web who uses that sticky poster tack stuff an "glues" the parts before hand with a small blob of the stuff under the part -- seems to work very well.

I also I eventually figured out to elevate my board on a box so I don't have to crane my neck down when wearing my high magnification glasses. Also, that way I can rest my elbows on the bench and my wrists on the board to keep everything steady.

>

They already do as you can't get many of the new best integrated circuits (like the DDS chips) in socketable DIP packages anymore.

I think one thing that would help is if the kits could contain a few extras of the generic "penny parts" like resistors and capacitors. This would help I think with some of the nervousness that comes from fear of having that one part "zing" to no man's land and put your project to a screeching halt :-p

Oh well, just some thoughts on the subject based on my experiences so far...

Hi Steve

Perhaps a option would be to have the chips which may a problem to some be pre-installed.
Myself I would rather do them.
Look forward to your next kit with SMT components.

Pat

Barry,

SMD stands for "surface mount device", SMT stands for "surface mount technology". These type of components mount directly on the copper PCB and don't have leads which go through the board to be soldered on the other side. SMD is used to assemble things like mobile phones and modern PCs, but they use VERY small components - we don't have any intention of going that small!

The mention of SMD always divides the amateur community much like transistors did in the valve (tube) era. I know from selling the Hunter kit that age isn't a barrier and unless your eyesight is very poor this isn't either. Most of us use magnifying glasses to assemble and check the work but then I do with through hole.

Throughout this trail of emails the benefits of SMD have been mentioned; component availability, quicker to assemble (no bending of wires and cutting of leads, more reproducible, lower cost, extra functionality... what have I forgotten? Against is the fact they are smaller and look quite bland not having pretty identifying colours!

As these devices have greater functionality - for example the Si570, a complete VFO 3-160MHz with 30PPM stability - the number of components for equal functionality is reduced and chances of building right first time increased.

Any how, that’s my opinion!

From: Norman Dennett
Topic: 2802 Message: 2834

Hi Steve,
I absolutly agree. If we had never had through hole components we'ed all be soldering away and think nothing of it.
I find it's not difficult once you get the hang of it, there's a learning curve like everything new, it is very different and you have to have the correct tools, materials and conditions. Just as you cannot mend the hole in a bucket with a 1mm tip, so you can't solder SMD components with an iron you stick in the fire! A "bit" exaggerated but I'm sure you get my drift!
There are plenty of posts on the web about the technique of mounting smd's and I'm sure Steve will include simple instructions without getting into the over complicated methods of doing the job.
A modern, high performance design using state of the art components. Go for it!
Consider this the first order.

Steve is absolutely right in what he says about smt/smd construction.
Yes it can be difficult.....only if you have never tried it!
Yes it does pose problems with the very small components.....only if you have never used them!
Yes construction methods are different.....you have to adapt your tools/facilities to cope with the change!
Yes eyesight can be a problem.....but there are many many aids on the market to help you overcome this problem!

I am a retiree, and have and still do make my own surface mount boards, I can still use a soldering iron and can
solder in the smallest of components without a problem.....so I say to all you doubting Thomases out there:
GIVE IT A TRY.....you might just find it is not a difficult as you think !!!

Find a supplier of say a small audio amp kit (something cheap) and purchase a kit and build it, once mastered
(like anything else) your confidence grows and things are`nt nearly as difficult as you thought.

One problem with SMT for beginners is that there are no really cheap kits to practice with. I wanted to do an "Introduction to SMT" project with my club last year and could not find a kit which was both useful and cheap (under £5/$8).

Might be worth thinking of also producing a simple audio amp, CW oscillator (or whatever) kit so those of us who are OK with SMT can teach the techniques to those less confident.

Still haven't found a good technique for finding dropped SMT components on my cluttered shack floor though :-)

I'm mulling the idea of putting together some very small cheap, simple, surface mount kits when I get some free time. After a while of looking around, I couldn't find any basic surface mount kits with decent professionally made boards (This is really important - bare copper with no solder mask is a pain when you're trying to learn to solder!).

If anyone would be interested in something like this, drop me an email off-list so I can gauge interest - I'll get back to you if my ideas come to fruition.

Hi,

A two-tone test generator would be handy for folks to set their PA's up. It could also double as a tone injector for testing audio circuits. And if you included a switched lm386 at the end then it also be a code-practice oscillator.

Elecraft wants $70 for theirs which is kind of a lot condsidering it is just an op-amp, transistor, and a few passive components.

Another pretty handy device is a capacitor ESR meter. I made one with an analog meter, but it probably could be done well with a PIC and LCD too.

A modern grid-dip meter would be pretty cool to do too (especially if it had a frequency counter in it).

73,

Mark.

As regards the ESR meter suggestion, I was going to build one recently until I found a superb ready built LCD & AVR based unit on Fleabay for under £15 including P&P that does ESR, transistor and fet testing and lead identification, inductor measurement and resistor measurement. It wasn't worth warming the soldering iron up at that price :-)

2850. Mkars 40 or 20m

Yahoo group: mkars80
Date: 2013-06-18 23:13:51 UTC
From: Daniel
Topic: 2628 Message: 2850

Hello Group!. I was looking for a HF transceiver kit with VFO stabilisation and frequency readout. Guys at
http://groups.yahoo.com/group/HuffPuffVFO/
pointed me to the MKARS80. I read the info about it and it looks a wise design. But I am interested in higher bands. I did a search on your Group and found a Sep 14, 2012 post from F5mpw with the same wish in the Subject.
So, has anyone tried to modify the MKARS for 7 or 14MHz?. I don't mean 28MHz because its IF would make image rejection unadequate.
Many thanks!
73s

I just saw the book "Wireless at War" in the New Books section of my library and picked it up for a peruse. On page 241 there is a photograph of the PCB of a radio and it immediately struck me as being very familiar.

On closer inspection it is an MKARS80 V3. It is in a chapter entitled "Technological Change: From Valves to Transistors and Integrated Circuits".

I thought people here may be interested.

The books details are:

Title: Wireless at war : developments in military and clandestine radio 1895-2012
Author: Peter R. Jensen.
Publisher: Kenthurst, N.S.W. : Rosenberg Publishing Pty Ltd Kenthurst, N.S.W.
ISBN: 9781922013477

Publishers Website: http://www.rosenbergpub.com.au/handleProduct.asp?id=163&catid=2
Amazon: http://www.amazon.com/Wireless-at-War-Peter-Jensen/dp/1922013471/ref=sr_1_3?ie=UTF8&qid=1372147932&sr=8-3&keywords=wireless+at+war

Looks like it has only just been published.

Hi

It seems to be available to order from Amazon in the UK but the price is
not fixed yet.
They are looking at £21.82 at the moment with a guarantee that if it
goes down you will be charged the lowest price.

http://www.amazon.co.uk/Wireless-at-War-Peter-Jensen/dp/1922013471/ref=sr_1_3?s=books&ie=UTF8&qid=1372158550&sr=1-3&keywords=wireless+at+war

From: zorge75
Topic: 2854 Message: 2854

The first start. Measuring the voltage of 5v and 8c - normal.

Without the microphone and antenna display shows the minimum maximum 4,341,615 - 4.388295.
Where to start looking for the problem?
Or to begin to connect the antenna?

2857. New Kit-Revisited

Yahoo group: mkars80
Date: 2013-07-18 14:38:26 UTC
From: Anthony
Topic: 2857 Message: 2857

Hi Steve and all.

I was thinking of building a dedicated PSK rig for 20metres.

PSK-20 as a kit was suggested, but the owner has stopped doing them.
I think he was finding support too arduous in this his retirement project.

I thought that this might be a good project for Radio-kits. It sort of follows on to the the SSB single bander. And I know Steves support is first rate.

I imagine a small Hammond type box, no controls, under a Netbook type PC or even a rasberry Pi.

Tony

Hi Tony.

If you want a 20M kit now, 'off the shelf' so to speak I'd recommend the ILER-20 from Javier Solens EA3GCY.

I've got two MKARS80s and think they're superb but like you I wanted something for 20M.

I'd already built an ILER-40 and that was a fabulous kit and worked like a charm. The same cane be said for the ILER-20.

Whilst the idea of a netbook driving it is a nice idea there's a lot to be said for running a QRP rig with a normal display if you're doing a bit of backpacking or simply QRP foot slogging. There's a lot less to carry about.

Just my two penn'orth.

Thank you Dale, I will have a look at the ILER-20.

I just liked the idea that the filters on the PSK-20 were wider than necessary for SSB and the whole PSK band was covered without tuning, everything done from the computer screen (except RF gain).

2860. Advice Please

Yahoo group: mkars80
Date: 2013-08-18 21:58:20 UTC
From: S
Topic: 2860 Message: 2860

i got my kit Saturday 17th August
Thanks Steve
Finished Construction Today And had to Debug finding it was deaf but after checking all the coils I found i had put 3 diodes round the wrong way and one transistor, I honestly thought i was being carefull as well.
the diodes were 11, 13, and 15 the 1n4148's and the transistor was Q16 BC547 Transistor. I had to remove them best i could and in the case of diode 13, and 15 mount on the underside as it was to awkward to get them back in component side, after doing this the mkars came to life it was working but just a slight hiss, now there is quite a bit of buzzing in the background amongst what i would class standard frequency noises but although hearing a few stations right in the mush I am not convinced it is working correctly. Unfortunately my freq counter decided it would no longer work so trying to get the 10mhz alignment fell to using a baofeng handheld using 100mhz fm and putting it close to the mkars adjusting C83 to leave a silent carrier on the hand held 10th harmonic not ideal but best i could do.
Question would be obviously the aforementioned is not ideal and probably a bit off 10mhz would this cause the buzzing and lack of signals ie stations on ssb , cw etc.
Im using a long random piece of wire as the antenna, but would expect more than i got, also im not over worried about setting tx up for the present due to wanting to mount the boards in a custom case where both sides will be easily got at etc for setting up.
Anyhow some advice the diodes are not particularly neat and do not sit nice and flush as mounted on the underside, I reused Q16 after turning it round the right way but im not sure if its damaged or any of the bodges i mean repairs are contributing to the current reception

Thanks for any Help

Simon G0MUC

I think it best I send you replacement components, do you have any desolder braid to clear the holes with?
With a long wire and gnd you should hear signals, especially in the evening so there may be some thing else wrong, the normal cause is poor joints on the transformer connections.
Regards,
Steve G6ALU

Hi Steve

yes i have desolder stuff both braid and sucker
I have checked and rechecked the coils there are no shorts and all connections to the board where clean, I did use a very fine sand paper to remove the enamel as the soldering iron i use is only 15w.
Until i found the faults i made ie diodes and transistor in the wrong way the board was deaf, but once corrected it did come to life but with the described symptoms, thats why i asked whether perhaps i had damaged the transistor hence the cause.

Regards Simon G0MUC

From: S
Topic: 2860 Message: 2863

Update

I have replaced the transistor and the diodes although the noises buzz etc is lower im still not receiving any stations ie ssb / cw rtty which i would expect to hear

I'm at wits end lol I have checked all the coils etc literally re flowed most joints and getting no where and the fear is totally messing it up completely. I have checked the voltages all on the rx side and all seem to tally with the help file.

So im out of ideas

btw im using the net and logging onto a sdr and the band is very lively i appreciate that one will be on a full size dedicated Antenna but i would still expect the mkars to receive something of what the sdr radio which is uk based as well.

Best thing is to do a voltage check on Q16, if its sick then receive performance will be poor.

Hi Ok

Emitter 7.3v
Base 3.96v
collector 3.8v

Hope that sounds ok taken in receive mode

> > the diodes were 11, 13, and 15 the 1n4148's and the transistor was Q16 BC547 Transistor. I had to remove them best i could and in the case of diode 13, and 15 mount on the underside as it was to awkward to get them back in component side, after doing this the mkars came to life it was working but just a slight hiss, now there is quite a bit of buzzing in the background amongst what i would class standard frequency noises but although hearing a few stations right in the mush I am not convinced it is working correctly. Unfortunately my freq counter decided it would no longer work so trying to get the 10mhz alignment fell to using a baofeng handheld using 100mhz fm and putting it close to the mkars adjusting C83 to leave a silent carrier on the hand held 10th harmonic not ideal but best i could do.
> > Question would be obviously the aforementioned is not ideal and probably a bit off 10mhz would this cause the buzzing and lack of signals ie stations on ssb , cw etc.

Check it against the voltage chart in the build manual...doesnt sound right.

I think it best you return it to me for service, I will only charge you return postage but turn round may be a week or two as I'm very busy at the moment.

Update

I have replaced the transistor and the diodes although the noises buzz etc is lower im still not receiving any stations ie ssb / cw rtty which i would expect to hear

I'm at wits end lol I have checked all the coils etc literally re flowed most joints and getting no where and the fear is totally messing it up completely. I have checked the voltages all on the rx side and all seem to tally with the help file.

So im out of ideas

btw im using the net and logging onto a sdr and the band is very lively i appreciate that one will be on a full size dedicated Antenna but i would still expect the mkars to receive something of what the sdr radio which is uk based as well.

Hi Steve

will be sending it back, but i will leave it until after the bank holiday weekend, I presume to the address as per label on back of the original Package you sent ??

Thanks Again

> > > the diodes were 11, 13, and 15 the 1n4148's and the transistor was Q16 BC547 Transistor. I had to remove them best i could and in the case of diode 13, and 15 mount on the underside as it was to awkward to get them back in component side, after doing this the mkars came to life it was working but just a slight hiss, now there is quite a bit of buzzing in the background amongst what i would class standard frequency noises but although hearing a few stations right in the mush I am not convinced it is working correctly. Unfortunately my freq counter decided it would no longer work so trying to get the 10mhz alignment fell to using a baofeng handheld using 100mhz fm and putting it close to the mkars adjusting C83 to leave a silent carrier on the hand held 10th harmonic not ideal but best i could do.
> > > Question would be obviously the aforementioned is not ideal and probably a bit off 10mhz would this cause the buzzing and lack of signals ie stations on ssb , cw etc.
> > > Im using a long random piece of wire as the antenna, but would expect more than i got, also im not over worried about setting tx up for the present due to wanting to mount the boards in a custom case where both sides will be easily got at etc for setting up.

Yes thats correct Simon, sorry I wasnt at the club, I didnt read my emails until it was too late...if had you could have left it with a guy I work with.

Will look at it as soon as possible, we should be at the MKARS radio rally on Sunday.

Hi Steve

will be sending it back, but i will leave it until after the bank holiday weekend, I presume to the address as per label on back of the original Package you sent ??

Thanks Again

G0MUC SIMON

Good evening Simon,
I've got your radio on the bench and found it receives well - I compared it with my MKARS80 to be sure, perhaps your antenna isn't adequate?

The frequency jumped between about 3.8 to 3.8MHz, not sure of the reason so will investigate further - otherwise its all set up now with a TX power of about 5W.

Will advise on the frequency issue in a day or two depending on work load.

Regards,
Steve G6ALU

Hi Steve

ok thanks it got in a bit of a mess after re winding coils etc

Iwas sure I done them correctly as well

thanks for looking at it and thanks for finishing the final tune up

im worried it got untidy and have nothing to stick the toriods down

Iwill have to work out an antenna for it it was strange even with a very long length of wire it seemed deaf I heard nothing bar heavy buzzing but I guess that could be as it was not cased / boxed I have got a box same spec as you sell size etc so will work it into that upon return.

thanks again and I hope after further investigation nothing is too amiss and it can be returned, I will await your findings and let me know about getting funds to you for the return

regards Simon

G0MUC

Hi Simon.

As a follower of your problems you may simply (sadly!) be experiencing heavy back ground noise on 80M from a nearby PLA (network adaptor) and/or Plasma TVs.
These can make 80M unusable from their radiated noise levels.

Hi Slim

Ah you have a point there, through a brick wall no more than 6 feet away we have a large plasma tv which the wife has on nearly 24 hours a day,I will have to conduct a few experiments once the mkars80 is back.
If i find anything conclusive then I'll post my findings .

2878. Watch Huff & Puff Live

Yahoo group: mkars80
Date: 2013-09-03 19:02:10 UTC
From: k1trb
Topic: 2878 Message: 2878

Hi

Here's something cool to watch: Huff & Puff in real time action as seen on the MKARS80.

Equipment: A 10x probe and an oscilloscope

OR

a PC soundcard oscilloscope program (like Visual Analyzer http://www.sillanumsoft.org/) and a 10x probe. Good 100MHz probes can be found cheap on eBay.

The waveform is about 10KHz so 50us per division would be about right. You can experiment. Later, when watching lock you'll want to slow down that sweep rate.

Clip the ground lead of the probe to ground on the MKARS80 (naturally). Clip the tip to R40 very near the 10MHz Test Point (TP).

Now turn on the MKARS80 and twist the tuning knob back and forth to keep it out of lock. While it's out of lock, adjust your scope so you get a nice wave form.

The Show: While the oscillator is unlocked (U), you are watching the 10KHz square wave generated by the internal pulse width modulator of the PIC processor. The control capacitor C50 and the filter resistor R40 average this wave to a DC voltage applied to the varactor Huff & Puff tuning diode D5. The average will be about 2.5V.

Now stop twisting the tuning knob and let the MKARS80 lock the frequency (+). You will see pulses going up and going down. The up ones are positive kicks to raise the voltage on C50 and the down ones lower the voltage on C50. There are two different sizes of kicks. When there has been a lot of drift in the past fraction of a second, the kick is big. If the drift has been small, the kick is small. Because the probe is draining charge off the capacitor C50, most of the pulses will go up.

Now a neat experiment. If you have an oscilloscope (PC folks can't do this one.) put it into DC coupling. Unlock the oscillator and see that the DC charge on C50 rides about 2.5v. In locked mode the up and down kicks are clearly visible.

If you turn the bandspread knob very slowly, lock can be maintained while you are causing the varactor to deliver more or less capacitance. And here's what is neat. In locked state you can watch the DC level slowly rise (or fall) as you slowly turn the bandspread knob. As the voltage approaches 5v (or 0v) it is difficult to put more (or less) charge on C50. Thus you can find a place where you have 1 or two bars and the Huff & Puff can no longer move the oscillator back onto frequency. The varactor has run out of range. A bit more of a turn on the knob and the oscillator will go out of lock.

So:

1. When unlocked, the pwm "levels" the voltage on the varactor at 2.5v

2. When locked, the pwm is turned off and little voltage kicks (positive or negative) raise or lower the voltage on the varactor to correct for oscillator drift.

Clever, huh?

regards
tom
k1trb
.

> If you turn the bandspread knob very slowly, lock can be maintained while you are causing the varactor to deliver more or less capacitance. And here's what is neat. In locked state you can watch the DC level slowly rise (or fall) as you slowly turn the bandspread knob. As the voltage approaches 5v (or 0v) it is difficult to put more (or less) charge on C50. Thus you can find a place where you have 1 or two bars and the Huff & Puff can no longer move the oscillator back onto frequency. The varactor has run out of range. A bit more of a turn on the knob and the oscillator will go out of lock.

Thanks ian

If you use a PC oscilloscope, you can still observe the "pulling" of the DC capacitor voltage on C50 by using a DC meter to measure the voltage at the other end of R40 where C50 has filtered it.

Do finish your MKARS80. It is a great little rig. Further it has seen the true test of design. The bidirectional IF is covered in EMRFD. The original BITX20 is a very nice rig. Then Steve took the design and improved those parts that were weakest: the best of incremental improvements.

Maybe you already know about Hans Summers website:
http://www.hanssummers.com/huffpuff.html
which covers Huff & Puff very well.

regards
tom

Hello Simon,if receive doesn't work when you get Mkars80 back, check your BNC connector on the antenna. I had a bad one and when changed receive was good.
Just a thought in case. 73 de John vo1jcc.

2882. Unlock the Huff & Puff

Yahoo group: mkars80
Date: 2013-09-05 18:36:28 UTC
From: k1trb
Topic: 2882 Message: 2882

Members of the group have asked: How can I unlock the vfo?

Oscillator drift can be checked this way.

Put a small clip lead on the connection between R40 and C50. Connect the other end of the clip lead to ground. R40 is located near the 10MHz test point. The clip lead goes on the side of R40 closest to C50.

It is safe to ground this point (do not ground the other end of R40) since it operates at DC potential and has high impedance to other connections in the circuit.

This disables the Huff & Puff correction voltage and therefore unlocks the vfo.

When ungrounded, you may measure the Huff & Puff correction voltage at this point. When unlocked, it is set at 2.5V. When locked it can go down to near 0 volts or up to near 5 volts. Very slowly turning the bandspread knob so as to maintain lock you can watch this voltage change as the Huff & Puff corrects for your bandspread changes.

regards
tom

Simon,

Checked the radio several times and all OK so sent it back on Friday recorded, hope you get it Monday if you don't have it already.

2884. Calibration BFO / counter

Yahoo group: mkars80
Date: 2013-09-11 12:33:30 UTC
From: Colin
Topic: 2884 Message: 2884

I built an MKARS 80 a couple of years ago, at the time I had no means of properly setting the BFO frequency.

I made the radio work by setting the BFO by ear, adjusting the trimmer until the received signal sounded 'right'.

I want to start using this rig for SOTA during the winter and I'm just wondering whether I should have another look into the rig's alignment. I did a SOTA activation with the rig last winter and reports were very good indeed, saying my audio sounded good and that it sounded like an off the shelf rig.

I now have a frequency counter that I trust to within a couple of tens of Hertz, plus a 100MHz scope, I'm debating whether to go back and re-do the rigs alignment or leave well enough alone.

If I was to try to re-align, would I simply just probe the 10MHz TP for 10MHz? Would the carrier nulling need to be done again with new BFO setting?

73, Colin
M1BUU (ex M0CGH)

Thanks Steve

Yes Received Today Many Thanks

The stamp is faded so im not sure what i owe ??
if you personal email me i will transfer funds to cover postage as agreed
Purchased all bits to make an aerial as im a bit limited to space going totry a Design by G7FEK if anyone googles that he designed A 46 ft multi band antenna for small gardens that works well on 80 meters

So hopefully have that up in a day or two weather permitting

Regards Simon

Hello Colin,
There's a lot to be said for the old maxim,
If it's not broke, don't fix it.
73 Ken g8beq

2888. Huff and Puff problem after QSO after few minutes QSO.

Yahoo group: mkars80
Date: 2013-09-11 22:33:46 UTC
From: johncronhelm@nl.rogers.com
Topic: 2888 Message: 2888

My huff and puff stabilizes after 20 mins warm up on receive,slightly unstable after 1st transmission and after 3or 4 mins. on a QSO the frequency can slip badly and interrupt qso. How can I fix this? Otherwise the rig works excellently. Thanks, John vo1jcc.

2889. Sorry for Typo!

Colin, all that may happen if your BFO is not at the correct frequency is:
- some sacrifice at the low end of the speech band (instead of being high-passed from 300Hz up by the xtal filter, it could be being cut from e. g. 400Hz, the audio will lack vowels strength. Or:
- if being wrong in the other direction, you will be unnecessarily forgiving some bass frequency at the expense of losing a little treble.
In short: as Steve points out, if your equipment sounds good, leave it as is!

Hi, if received reports are OK then I wouldn't
worry too much. BFO should be OK.
Steve

I built an MKARS 80 a couple of years ago, at the time I had
no means of properly setting the BFO frequency.

I made the radio work by setting the BFO by ear, adjusting
the trimmer until the received signal sounded
'right'.

I want to start using this rig for SOTA during the winter
and I'm just wondering whether I should have another
look into the rig's alignment. I did a SOTA activation
with the rig last winter and reports were very good indeed,
saying my audio sounded good and that it sounded like an off
the shelf rig.

I now have a frequency counter that I trust to within a
couple of tens of Hertz, plus a 100MHz scope, I'm
debating whether to go back and re-do the rigs alignment or
leave well enough alone.

If I was to try to re-align, would I simply just probe the
10MHz TP for 10MHz? Would the carrier nulling need to be
done again with new BFO setting?

Thanks Steve, Ken and Daniel.

I find it's always tempting to go back to home constructed rigs to try and improve the calibrartion / alignment!

I've listened again to the recording I made of the MKARS and every single QSO gives a good report and some even mention that the audio sounds good. I think I will leave the rig alone.

What got me thinking about re-alignment was that I was listening to some CW on the rig since that is my main mode now and I couldn't get the displayed frequnecy to match up with the RBN spot for the CW station, I later worked out the reason for this of course! SSB is a whole different world away from CW, I'm only used to building CW rigs.

I would be quite tempted by the CW option for the MKARS80 should it become available again.

Looking forward to using my rig this winter!

Thanks, 73

Thanks Steve, that's good to know.

Will you be attending Rishworth again at the end of October? Maybe I could pick up a CW adapter form you there?

As A follow to this i found the following..

The plasma tv in the front room does indeed account for most of the buzzing , also my Laptop once put on charge increases the problem.
So Slim you hit the nail on the head unfortunately.

on a brighter note the MKARS80 came back i have rehoused it in a new case fitted a light up lcd module, internal psu etc and when the rfi problems are turned to the off position the little radio is fine and im extremely pleased.

I Wired a mic earlier and i now I also have an antenna operational so im going to attempt the first QSO later tonight (rfi permitting lol)

Hi, I repeat my previous answer that yahoo has not published :
I had the same issue, and solved it by replacing a few capacitors with NPO units...it is easy to make a mistake during building steps !
Good luck

2898. Replacement variable capacitor

Yahoo group: mkars80
Date: 2013-09-17 19:06:51 UTC
From: S
Topic: 2898 Message: 2898

Can anybody let me no where I can get a Replacement variable capacitor, the polyvaricon. I had an accident and broke a leg off.
There seems to be a few on the dreaded fleebay but also some more solid looking ones.
The replacement is going in a custom case and so will not be board mounted, failing a direct replacement any idea of what value of pf i should be looking for ??

thanks in advance Simon

Me!

Send me your address (again?) by private email and I will send you the
standard type. Capacitance is 3 - 142pF.

Hi Steve

I did reply by email but not sure if you got it ??

also i asked, and maybe someone could help here as well
I converted a Yoga mic (same as in files Maplin Mic) and although its an eletret mic im getting reports before the cap broke of bassy audio heavy mid range. would it be better to try a cheap pc mic and see if any different ?
I have read through some posts and seen that if the bfo is off ie not @10mhz this could be a factor although i think when it went back to you that would have been checked.
Incoming audio from now received stations is fine, so any hints or ideas would be appreciated

2903. deaf receiver

Yahoo group: mkars80
Date: 2013-09-22 10:50:52 UTC
From: christopher_iles@btinternet.com
Topic: 2903 Message: 2903

Hello all,

A while ago I bought a blown-up mkars80 off ebay. It had been reverse polarised and the fuse had been shorted out with a thick piece of wire.

Many hours (and transistors) later, I have the receiver working but it seems quite deaf. There is also a ticking noise at roughly 1 Hertz.

The radio is stable with no drift; I have rewound the mixer coils and replaced the diodes as a matter of course, the voltages compared with the voltage chart are ok and the aerial I'm using is an inverted v at 30 feet.

Any ideas please?

Thanks. Chris, G0VOE.

Hi Chris,

You've probably seen mention before that the biggest cause of deafness is poor connections on the mixer transformers, it takes a lot of heat to break down the enamel on the wire... apart from that do a voltage check. Does it transmit OK?

2906. Re: deaf receiver

Yahoo group: mkars80
Date: 2013-09-23 06:31:49 UTC
From: christopher_iles@btinternet.com
Topic: 2903 Message: 2906

Hi Steve,

Many thanks for the reply.

On power up the display shows version 1.1 software.

I've not tested the transmitter at all yet, I wanted to get the receiver working properly first.

I went for the mixer transformers, removed them, rewound them and put them back. The solder joints look good but I will go over them again.

Also, I replaced the mixer diodes in case any were faulty. All the semiconductors and electrolytics on the pcb are in the right way round, all other components are in the correct place too.

I did a check on the low pass filter as well in case that was the culprit but that's ok too.

When I compared the transistor voltages against the chart they were all ok which then suggested a mixer or filter problem.

When I hear stations the audio quality is good but the signals are very weak compared with my main station receiver.

That's as far as I've got Steve.

Kind regards,

Chris. G0VOE.

Hi Steve,

Thanks for the super fast reply!

I'm a bit confused now; the pcb has mkars80 V3 on it which suggests it's a later board but with earlier software.

The only green capacitors on the pcb are the two 1nF capacitors near the variable tuning cap.

These are identical to the ones in the photo on the home page. Also, there doesn't appear to be any drift and the huff and puff isn't going mad.

Thanks for taking your time to help, it is really appreciated.

Kind regards,

Chris.

Thanks Steve,

I probably have some polystyrene capacitors which I could try. When I get it working right, I'll be sure to let you know.

Kind regards,

Chris.

Chris, it all tallies OK. All PCBs sold are V3, version numbers on PCB and software will be different as they develop at different times. Those are the green caps that need to be replaced, they may be OK with early software but not with version 1.2 as the Huff ans Puff works in a different way and is "quieter" in operation.

2911. Huff & Puff problem

Yahoo group: mkars80
Date: 2013-09-23 14:36:13 UTC
From: johncronhelm@nl.rogers.com
Topic: 2911 Message: 2911

Hi Steve,prior to changing C59,60 have done some tests and found when I pressed PTT close to main rig on the same frequency its meter showed S3 Should I adjust R59, and could this have caused instability of Huff & Puff.

Hello John,

No it shouldn't affect the Huff and Puff, follow the instructions in the construction manual if you plan on making adjustments.

Thanks Steve, how important is it to have S= 0 on nearby receiver when PTT pressed on MKARS80,as regards its general operation ? Regards, John.

John,
You probably wont be able to get it to S0, dont worry about it too much. If you get a carrier leak the listener would get a tone if they tune away from you.
Steve

Subject: [mkars80] track side pcb

Hello,

Could anyone please send me a picture of the track side of the mixer?

I've changed the diodes and had the transformers out that many times that I'm going to have to hard wire it this time as some of the tracks are now missing.

I could figure it out from the circuit diagram but it would be a lot easier if I had a picture of this area.

Thanks in anticipation,

Chris. G0VOE.

2917. Help with Drifting while in TX with Base Mic

Yahoo group: mkars80
Date: 2013-10-06 18:12:03 UTC
From: S
Topic: 2917 Message: 2917

I had problems with muffled audio after using an yoga mic found in the help files converted hand held mic, so steve sent some replacement xtals as this may have been the problem. It did improve the audio thank you.

however in an attempt to get a punchier signal out QRP i wired up an old CB Radio desk mic which is an electret based device powered with a 9v battery (also has an echo facility but i do not think appropriate for 80m lol).

The problem now is the Huff & Puff locks but as soon as i key the mic it unlocks drifting up or down the band only a few 100hz but not acceptable in qso. Now even without any speech when keying mic this happens, I have tested by keying or forcing tx with no mic attached and its fine solid so its something to do with the microphone.

any ideas how to stop this, Im wondering if the mic is trying to draw current and destabilising the MKARS80 but i do not know what to try to stop this, the mic requires no additional power as it should be self sufficient with the internal battery.

Thanks in advance Simon

De G0MUC

Mic could have excessive output level, can you turn the level down?

yes even when the mic level is turned to zero the radio starts drifting, but once the mic is removed and the yoga mic attached its fine.

Strange... the only thing I can think is it generates a sharp DC transient when you press the PTT, I guess it powers up the amp each time. Cant really think of a way around this other than reducing the coupling capacitor or putting a lower value in series. This though will reduce the low frequency response...for a start try a 100nF and work up.

Hi Steve

Sorry im going to sound really stupid now lol
where am i trying a 100nf ??
ie i built the mkars80 into a large enclosure and from the main pcb using the jack socket a cable to a 4 pin mic socket on the fascia so it seemed like a regular set.

So im not sure where to put a capacitor sorry

Place it in series with the microphone "live" lead, 100nF is only a starting point just to see if it cures it - you will need a larger value for decent audio.

Hi Steve

Sorry im going to sound really stupid now lol
where am i trying a 100nf ??
ie i built the mkars80 into a large enclosure and from the main pcb using the jack socket a cable to a 4 pin mic socket on the fascia so it seemed like a regular set.

So im not sure where to put a capacitor sorry

Simon

Hi Steve

I have since found the Desk Mic has a fault so scraped that idea but i am on the look out for a suitable compatible microphone.
Rather than use a pc mic which i understand work fine maybe i will try an ex pmr one, several are available @ a few pounds that are electret so i would imagine its a case of try and see and hopefully get good results.

regards Simon

Simon:
Sorry to know that microphone is faulty, I was thinking a possible explanation to the frequency drift, but it will be technically enlightening for the Group if you can make one more try.
Let's see:
- a Huff & Puff is able to correct slow drifts, not sudden ones, these will make it lock into a new, say, "harmonic" of the reference.
- you notice the drift even with no modulation, so we can discard a brownout in the power supply.
- something is pulling the VFO, and it's not the voltage supply. It CAN be RF leaking into this stage.
- when there exist RF currents flowing in the outer surface of a coax, everything attached to the shack end of the line is "hot" with RF, you touch the rig and your body becomes part of the antenna system. Even SWR meters are fooled by unbalanced line currents.
Putting all this together, could it be that:
- the problematic microphone has a longer cable? (more radiation into the shack)
- your MKARS is not within a closed metal box? This could be worse if the variable cap is not screwed to the PCB but panel mounted and with cable connections to the PCB.
Try to add a common-mode balun right at the antenna connection of the rig, e.g. several coax turns around a ferrite toroid. This will force the currents in the center conductor and shield to equalize and your rig will be more "cool". And/or route the mic cable in a different direction, or shorten it.
If you can try this, please let us know the results.
Cheers
Daniel Perez LW1ECP

yes even when the mic level is turned to zero the radio starts drifting, but once the mic is removed and the yoga mic attached its fine.
Simon

Hi Daniel

Interesting reading, but to answer some of your points
correct the mkars is not mounted in its metal enclosure but i have done a varactor mod which everything is earthed to the main board etc.
The drifting happens even using a dummy load as well as the main antenna, I have discovered / believe the desk mic has a fault on the basis as it is keyed the mkars unlocks the huff and puff and startsto do its drift, if i pick the mic up and physically move it around loads of crackling can be heard as if a bad earth or loose connection inside it. Maybe i will strip it down and investigate later.
Also after a few seconds the Huff and Puff does manage to lock and stay locked until the ptt is depressed / unlocked and then once again the mkars drifts and again a few seconds later re locks, if that makes any sense.

Topic: 2917 Message: 2926

ok changed to a fist mic still electret based
do not get the drift while going to tx making an over but as soon as i release the ptt the huff and puff unlocks
Now i have taken heed of Daniels post, but this happens on dummy load as well as on the antenna. Also i have re routed the extension mic wires that come from the jack socket to a standard 4 pin socket mounted on my fascia but no difference. So again im stuck i can not keep getting mic's and falling on the same problem.

@ steve should i start trying the capacitor mod you suggested earlier in this thread ??

regards Simon G0MUC

Shouldn't need any modifying if you are using a standard electret microphone... remind me of the other mods you have made to the radio, perhaps there is a clue there.

Steve

Hello Simon,
Did you have this problem before you did the
varicap mod ' ? If not it's the first place to look hi.
Have you tried a large value electrolytic across the
power supply at the set ? Sounds as if you have a
voltage transient when you change the load on the
supply and it's reaching the varicap.

Hi Steve

Firstly if i use the yoga mic adapted from the file section under maplin mic it works fine although the audio reports are not to good they improved with the xtal change
the mods carried out are the varactor diode mod again in files by G8EEL using 2 diodes i found problems with others but this one is fine all is kept neat using pads glued to where the varicon was.
another mod done is the AGC by Pa0rcl using a small bit of pcb mounted above the board and held in place with stiff wire soldered to earth on the main board no more than 1 - 2 cms just clearing onboard components.
I also have a lit up display changed the original and an internal psu from the mains only good for a couple of amps but more than adequate.

My feelings are that the mods done are not affecting the radio as the yoga mic is fine but the mics i have tried since have had no internal mods done and are as standard

thanks Simon

Topic: 2917 Message: 2930

Hi Ken

unfortunately i was using a yoga mic modded as per file section. titled maplin mic i had problems with reported audio steve sent replacement xtals it helped but i was not happy. I done the varactor mod and changed to a desk mic hence this thread but going back to the yoga all is fine.
The mic im trying now is one from a modern cb radio but it is electret and when i monitor the audio it sounds very good the only problem as soon as the ptt is released the radio unlocks and drifts a few hundred hertz

regards Simon

Hi Steve

The onboard 7808 taken from one pad where the pot for fine tune used to be, i do have some large package 7808's should i try giving its own regulator i did that for the digital display with a 7805 ??

Hi Steve

yes the 78L08 is fine slightly warm after about an hour and the test meter shows 8.1 volts constant with no variation checked from the pad where i have taken power (the hole where the 10k fine tuning pot was.

2936. Re: deaf receiver

Yahoo group: mkars80
Date: 2013-10-16 10:14:10 UTC
From: christopher_iles@btinternet.com
Topic: 2903 Message: 2936

Changed the 1n caps for polystyrene ones, radio is very stable. However, the audio output is still very low. I have confirmed that the filters and rf amp are working fine as is the mixer (which I've rebuilt three times!). I have also changed the LM386 and made sure that all electrolytics are correctly placed and oriented.
I can hear stations very clearly but at VERY low volume (the rf gain pot is fully up). Any ideas?
Thanks,
Chris.

Hi Steve,
Fired up the transmitter, full 5 watts and brilliant audio! However, on transmit there is still hissing coming out of the loudspeaker. I tested the tx into a dummy load and my partner listened on an rx downstairs and the audio was bang on. What next??? Might just buy a kit from you and build it myself...this one's cost me about £100 quid so far! Hi!
Cheers,

Hi Steve,
The radio's standard but the pcb has had a hard time! I'm going to persevere a while longer with it though as it's getting there slowly. However, I will bear your very kind offer in mind!
Best regards,
Chris.

Hi Steve,
Fired up the transmitter, full 5 watts and brilliant audio! However, on transmit there is still hissing coming out of the loudspeaker. I tested the tx into a dummy load and my partner listened on an rx downstairs and the audio was bang on. What next??? Might just buy a kit from you and build it myself...this one's cost me about £100 quid so far! Hi!
Cheers,

2944. Re: Help with Drifting while in TX with Base Mic

Yahoo group: mkars80
Date: 2013-10-17 17:05:40 UTC
From: S
Topic: 2917 Message: 2944

Ok Next logical stage..
I have removed all mods bar the display
The Display has its own regulator 78L05 off board to give power and this does not affect performance of the mkars80
So im back to standard varicon tuning the agc removed and powered straight from external psu rather than the small supply i built in the enclosure.
results the same Huff and Puff locks key the mic make an over still locked, Release the ptt and off it goes drifting for a couple of sec a few 100 hertz and then relocks.
So now I am at a loss with the yoga mic fine but still poor audio. use a different mic super audio and the above.
I have picked up a second mklars80 private sale from ebay and its in a poor shape but after a tidy i have got it working so i think my board i will remove from my enclosure and set in the correct box and transfer the newer board into my custom enclosure and see what is the result
Mean while if any other ideas to the initial problem let me know I wil try and source a poundshop pc mic and try that over the weekend.

Hi Allen

Thanks just looked @ the maplin's website and that mic looks ok, I
guess some kind of ptt would have to made / added.
Do you know if this is a tried and tested with the Mkars80 I really need to get a working mic with good sounding audio reports and then try others, otherwise i could end up trying numerous only to find a simple non mic related in the future

Sorry for the delay (club night)

It worked for me simon mine is a grey one, they have changed the colour to black it seems
I put a switch on the top,audio reports have been ok. I tried several, this one for the price and a little work
did the job.if you need a short length of screened cable email direct i have a little left over surplus.
I'm sure there are plenty of microphones that maybe more suitable for portable ops,possibly one of the CB type.

Sorted! Q3 was dragging the audio down..replaced it! Contest on tonight, heard Germany, Spain, France, Sweden and UK stations...well pleased!

--- In mkars80@..., "christopher_iles@..." <christopher_iles@...> wrote:

From: christopher_iles@btinternet.com
Topic: 2903 Message: 2951

Q3 was dragging the audio down, replaced it and have heard UK, France, Germany, Spain and Sweden tonight. Fantastic! TX is now putting 6w into a dummy load...problems with my aerial means I can't transmit for now but I'm sure it will be good. Brilliant rig!

From: Steve G6ALU
Topic: 2903 Message: 2952

Hi Chris,

Your radio certainly has had a hard life but I'm glad its all working for you now! I've not had that transistor fail before so I guess it met with an accident with the former owner....

Steve

Mike,
One piece of advice regarding the transformers -make sure the wire is properly "tinned" before fitting to the PCB, if they aren't then the joint may look good but won't have continuity. A typical symptom would be a deaf receiver and low output transmitter.
Build it carefully and it will work, I've found that the first to finish are the last to be on the air!

I am currently in Atlanta, Georgia USA for a few weeks and have my MKARS80 with me.
I tried to call, but so far no success. I hear plenty of stations, but it seems like all little 'private' nets.

My antenna is an improvished inv.V from the apartment window .
Is there anyone in this area who would like to try? Any evening should be ok.
Please suggest a time/frequency

Thanks and 73

2967. Internal Speaker

Yahoo group: mkars80
Date: 2013-12-01 14:04:38 UTC
From: mikey65mk
Topic: 2967 Message: 2967

I have come along nicely through bag 1 of my kit, and beginning on second bag of parts this morning. So far no mistakes that I can see, but I haven't gotten to the transformer winding yet. Not using the metric system on a daily basis, I hope that my little metric rule will help me cut the proper lengths of wire without error the first time. One question here: Is there any winding that should be modified to accomodate the US 80 meter band-plan as I will be using 3.800-4.000 MHz for sideband operation?
Am I correct in reading ahead, that a small internal speaker can be located within the enclosure I ordered along with the kit?
That's about it for now, thanks for your comments! I am having a very nice holiday here building this wonderful radio.

Topic: 2967 Message: 2968

Mike,

For 3.8 - 4.0 MHz, there is some adjustment available with the orange trimmer, if this isn't enough a small capacitor can be added across C47. The turns on L5 can be INCREASED but I can only guestimate what to, you could start with 2 more as its not too difficult to remove them later if too many!

Some have fitted a small loudspeaker but there are a couple of issues you should be aware of before cutting any holes - first the vibrations from the speaker can cause the VFO coil to move in sympathy, this can cause strange distortion on the incoming signal or even feedback. This can be mitigated against by fixing the coil down with a non corrosive silicon glue or similar. Second is the detuning effect the speaker magnet has on any tuned circuit.

My advice is to get it working first then before drilling holes for the speaker fit it into a dummy lid (cardboard) and check for unwanted results.

Regards,
Steve G6ALU

2971. Another radio is complete. Almost.

Yahoo group: mkars80
Date: 2013-12-05 05:08:31 UTC
From: petro.1968
Topic: 2971 Message: 2971

Hello everybody!

I ordered two kits of the famous MKARS-80.

#1
The problem I had with the first one was strange.
It start up from the first time, but after awhile start cracking(noise). And then completely fade away as a receiver.
I studied the circuits, re-solder some points... nothing. It was receiving, but very weak output. I came up to the idea that the Operating Amplifier (or about) was wrong.
One day my brother came up and tried to help me and began drawing a tooth pick on PCB for cleaning. And After awhile it came alive. Loud and clear.
But it still switch on silence mode after 1/2 to an hour.
And cant lock on a frequency. Running up and down almost 1kHz. May be because I remove C33 to use it on #2.

#2
All went well. I was more clean in soldering. Start up immediately but it was a little up - 3.757-4.115. Thanks to Steve that remind me about the orange capacitor. I put it in the band but it doesn't cover all the band. 3.522-3.884 Couldn't make it better.
Adjusted the transmitter and seems like working. I have digital cheap multimeter only. For a dummy I used 110V/25W light bulb. Comes very close to 50 Ohm.

But I had some nervs about transmitting. First, I forgot about R2. And second, my microphone was not working. No "luck" on both units about transmitting. And my suspicious was every where but on the mike. Finally I decided to try another one that I pull out from an old cheap computer headset. And I got the transmission working! I suspect the other mike may be is small buzzer, I picked it up from a box with parts.

Today I put #2 in the box! And still working!
Now will try to install a small speaker in it.

If someone have an idea how to widen a little the band I would appreciate.

My best regards to all of you!
And special thanks to Steve to come up with such a nice product!

Peter, Vancouver/Canada

I just re-red the specifications of the Mkars80.
It reads: "Operating Frequency 3.5 - 3.8 MHz"

So nothing wrong.

Any idea about small portable antenna for this beast?
I am thinking about http://nmwilliam.tripod.com/mla.html
Is anithing smaller?

2973. Re: [mkars80] Another radio is complete. Almost.

Hello Petro,
You can increase the tuning range to cover 3.5 to 4 MHz
by setting the trimmer on the back of the tuning cap to
minimum value [fully out of mesh] and reducing the value of
C38. As you increase the frequency sweep of the tuning cap
you will move it out of band, ie you may get for example 3.3 to
3.9MHz or whatever, you then need to adjust the turns on L5.
As the VFO goes lower in frequency your operating frequency
increases so reducing the cap values you go LF, you need to
add a turn or two to L5 to bring it back HF.

Thanks a lot Ken! I may play about it.

Now I encounter something else. After about 30 min on Rx, I hear kind of thunder for a few seconds (I use my home stereo) and then: 1.receiver go silent; 2.Q1 go hot. 3. Voltage on the display fall significantly. It falls from 12.3V to 6.+V. I use (I gess) an old mobile charger which gives 12V impulse voltage and current 1A.

I wander why.
I noticed that on fully anticlockwise R2, the current goes from 0.11A Rx to 0.24A Tx. Which is 130mA more. Instead of 50mA more.

Any idea is welcome!

2976. Re: Another radio is complete. Almost.

Update. I mess it up.

The previously described problem was on adjusting R2 by the manual (current on Tx +50mA). It was 0.24A (Tx; silence) so I turn R2 to 0.31A.

Now, over 1 hour it is receiving normal. On R2 fully antyclockwise! And LED extinguish ocasionely when speaking on the mike. Which seems normal. ??? scratch on head...

2977. Re: [mkars80] Re: Another radio is complete. Almost.

Yes, that is normal, the led flickers when you talk into it, and should come back on when silent.
It is a good indication that there is no rf feedback, a problem
I've had a few times especially with a bad SWR.

GL!

Hello Petro,
I am a little confused by your description, you say you're
on Rx when the audio goes silent and Q1 gets hot.
Q1 only has supply volts on transmit so if it gets hot on receive
it looks like either your PTT line has an intermittant short to
ground and the set is going into transmit or you have an
unintended bridge between tracks putting supply volts onto Q1
when receiving. R2 sets the bias voltage for Q1, it should have
no effect at all when receiving. If you mean these things happen when
you transmit you must remember that Q1 needs a heatsink which can
be the metal case. If no heatsink it will get very hot and could be
destroyed although FETs usually reduce current as they get hot.
If Q1 gets hot on transmit with R2 fully anticlockwise you may have a bad
connections at the ground end of R2. When fully anticlockwise there should
be no bias on the gate of Q1 and it should not conduct, if you transmit
like this the SSB will be very distorted.
Hope that this helps,
73 Ken g8beq

Hello again Peter [I've been calling you Petro as per the
"from" header, but see you signed as Peter hi].
I see from your first mail that you're using a 110 volt 25 watt
bulb as a dummy load, you say near enough 50 ohms but I
doubt that very much. When hot that bulb will be 27 ohms
and when cold [as it will be even with 5 watts of RF] it will
be much lower resistance, the impedance is anyones guess
depending on whether the filament is coiled etc. It's worth
getting a 50 ohm 5 watt non inductive resistor if possible.
73 Ken g8beq

2980. Re: Another radio is complete. Almost.

Yahoo group: mkars80

From: petro.1968
Topic: 2971 Message: 2980

Hi Ken, thanks for comming by!

I checked the bulb more carefuly. It is 51-52 Ohms cold. And after observing with magnifying lens... yes, it is very fine coiled.
So on Tx+50mA on the bulb it is 0.31A. And it is the same on long wire.

It is strange, because after my previous post I was running the radio (Rx) for hours. On R2 fully anticlockwise. AND then adjustet by the manual. AND out of the box.

On Tx I either keep a finger on Q1 or with a hearsink.
I didn't cut the legs of Q1 so they ate poping about 5-6mm (1/4") over the PCB and maybe possible to touch the boxing. But why after long 30min?

I am going to cut the poping legs of Q1 and put the radio back in the box. And see what hapen.

I just noticed while putting it in the box, the legs of Q1 could not touch the box.

It is in the box now, on Rx.

It receives much much better when connected to my home stereo, than to speaker alone. I gess because of the ground that the stereo provide.

I am so happy. My radio stil working (R).
And I try my new small loop. Until now I was using a long (6-7m) wire. Now with the loop the radio is receiving on speaker alone. Seems it is related to balanced and unbalansed antena type. I am discovering the weel.
With the loop it is more quiter, but more clear.
I just iprovised with this loop. The loop is from thick wire (not pipe). And I use two sheets of aluminum foil and this foamy packing sheet between them. And "tunning" is sliding a light magazin on top pressing the foil closer. Works.

Hi,
Some comments from me!

The PA stage of the MKARS80 is normally very stable, instances where instability have been noted are:

* TR1 tab has been screwed to a large piece of non-grounded metal as a heat sink - this is not good as even if an insulating washer is used TR1 drain will capacitively couple into the heat sink which in turn can couple back into the amplifier or previous stages leading to oscillation.
* Very poor antenna (or load) VSWR - I've run the radio into a high VSWR (perhaps > 6:1) without problem but would normally recommend keeping it below 3:1 if only to get a reasonable power transfer to the antenna!
* Badly screened microphone lead - TX RF gets into the microphone amplifier and is rectified and "seen" as audio causing an audio frequency feedback.
* High impedance power source - make sure your power supply can source enough current - the radio typically draws about 1.2A or more on peaks so use a power supply capable of this. In addition its possible RF can get back into the power supply and cause the output to fluctuate which will give the impression of RF instability and will be audible on your transmitted signal.

Any combination of the above could cause feedback - for example high VSWR and a poor quality microphone lead.

Bias for the output stage is removed during receive so if the build quality is reasonable - and no components have failed - then TX power should cease when going to receive and TR1 can't get hot in receive.

I'm concerned that at some point R2 has been turned fully clockwise whilst in transmit mode - this would normally result in a burned out IRF510 which can then get hot during receive, they typically get a drain to source "leak" when dead. A transistor failed in this way often causes R2 to fail passing volts back down the TX rail whilst in receive and in turn causes the mute transistor Q3 to turn on and reduce or kill received audio.

Check to see if R2 reads sensible between its junction with R1 and ground.

Hope this helps.

From: raojones@talk21.com
Topic: 2985 Message: 2985

Have just completed the kit without problems. Initial testing went according to the manual. On connecting IC2 and the display there was no response, screen is blank. have checked the wiring and spot checks for various voltages are in order. At present I am resoldering all the connections. Wondered if any one else had this problem ?

Aled,

First make sure the wires you soldered into the display are fully
engaging with the socket. Next measure each display connection back to
the micro for continuity and between ajacent pins which shouldn't have
continuity.
If that doesn't find your problem come back.

Steve,

Thanks for a very prompt reply. On examining the display connections very closely , I discovered I had used a thiner wire on two of the pins. They seemed to be making contact so I replaced them with thicker wire and this worked. Display now visible, on to the next stages of testing.

Mats,
I've not had this before, I can't think of a single error / fault that
would causes this - is this noise with an antenna connected?

The first thing to do is check for poor solder joints and blobs of
solder, to aid this I have placed 2 plots of tracks in the files section
of this group, look in MKARS80 Fault Finding folder, the link from my
end is
http://uk.groups.yahoo.com/neo/groups/mkars80/files/MKARS80%20Fault%20finding/

Steve
It does not matter if antenna is connected or not, the noise is still there.
I will do a check of soldering to see if it is any fault there.

Just to elaborate a little - with the added heat due to the high transmit duty cycle the PCB warms up and may make the VFO drift beyond the Huff and Puff capture range, monitor this by watching the bar graph on bottom line of display. If you are unsure do a trial run into a dummy load with an imaginary QSO!
Be careful not to overdrive the TX, don't drive it so the TX LED is extinguished...perhaps just flickering.

Hi,

I have run PSK on my MCARS80 and I had the same problem of drift.

All I did was to install a small 12V fan from an old PC motherboard inside the case and drilled a few small hols in the case to allow for the fans air flow.

After fitting the fan, it doesn't drift

Thanks for all the replies,

SO the general concensus is to watch for heat induced drift, making cooling modifications if required. No problem. I can fit a larger heatsink to the outside of the case,and adding a small fan is easily done. And of course to keep to short overs!

What im trying to achieve is a simple demo of amateur radio for interested youth groups, something that shows that the hobby really can be low cost but effective with low power, home made equipment,

Cheers

Martin

Remarcable receiver! Thanks Steve!
So, my kit#1 is complete in the box.
I had the oportunity to check the radio on a profesional equipment. Sensitivity: -122dBi (or dBm...not sure); MDS: 0.1uV. The guy was impressed.

Lots of nights I was listening the local networks and even checked-in ones. With a help of a very local radio.
My first trys with the small loop was on the edge of tunning. I put some extra capacitance and it got very loud when tuned.
This evening I went 10-15km out of Vancouver (Canada) and stopped at about 400m above see level (and the city). The loop next to the car with about 5m coax. The radio was much quiter! Almost no noise when tuned. And a lot of stations all over the band. And this time I was listening both stations. With some exeptions. I heard Texas on 1kWt (if I recall). I tryed to call few times and one of the stations heard me but not enough for QSO. I think because the antenna wasn't in tune. Next time I will try with some random wire.
I noticed that when transmit I can hear my voice on the speaker. I plug in bigger 10W/8ohm speaker from a TV. Yes, it was not laud, but easily noticeble. I wander if the internal speaker can help for this.
I inserted a small 3.5cm speaker.
No issues with fading, cracking and silencing after 1/2 hour.
The kit#2. Was checked by the guy too. Receiver is the same sensitivity, but no transmition. Will pay more atention later.

And yes, I get my license on Jan 14, 2014 - 73 de VE7BUL

Last evening, I tryed to tune #1 R59&C103 - mixer balance, by hearing with #2 radio, Both radios near me and about 0.5m apart. I was transmitting on the small loop at the other corner of the room. Receiving radio had about 0.2m tin wire for antenna. And not in box.

It was interesting that I had to tune the receiver about 300Hz down the Tx frequency. And I had almost perfect audio. Like FM quality. And I hear a continues tone (I think, not sure about direction) above the perfect Rx which is 300Hz down.
Is that tone the carrier?
Do I have to look for zero carrier Tx or it is fine just to minimise it?

Regards, Peter.

From: <petro.1968@...>
Topic: 3012 Message: 3012

Hi, today I realize my idea. I bought second hand commercial Panasonic headphones with mike that can turn up (to the head) and down. So I cut the rotating part and fix it in front of the box (the oposite of the cables side). So it can turn next to the radio (compact) or turn up for speaking. And install PTT buton on the bottom left corner of the face (up) side. And still can plug external mike and work with it.

So now it has a small internal speaker and compact attached mike. And integrated PTT button. And the all it needs to work now is antenna and power.

Theese days I made a dipol antenna and deploy it .. on the grass. And made contact about 200km. In the mud, but contact.

I was tinking about varicap mode. It is good enough as it is now.
Thanks Steve!

Just checked the other unit (#2). Current on
Rx - 0.11A

Now Tx. When adjust it as in the manual, the modulation LED goes on for a blink time and goes off again. In silence. When I turn the pot backwards, to have the modulation, the current goes to 0.23A and barely goes to 0.25 if blow on the mike.

I have no experience with field transistors. Any ideas? Rx is Ok. And it is working almost two hours as it should.

Thank for the reply Steve! I use the same computer power suply on both units. It can deliver 12V at 21A. I think it is OK. The MKARS80 displays 12.1V and does not change. The power cord is thick enough too.

And to add that in fully anticlockwise pot., on silent transmision, the current is the same 0,23A

Thanks,
Peter.

OK, 0.23A is probably normal for 12V. The preset should be slowly turned clockwise until a current of 0.23 + 0.05 = 0.28A is obtained whilst on "silent" transmit.

I did that. And decided to listen it on the working #1 rig. On 2-3 feet wire and head phones. First I start signal/tone generator and tune Rx so to hear same tone. It hapens to be 230Hz below Tx frequence. I Tx on my magnet loop. The tone is received quite distorted.

I decided to put this experiment because before that I did it with my voice while playing with the preset. I was able to hear what was going out of the rig. Loud or quite my voice was always distorted. I would say more than 50%. Seemed like my voice was modulated with about 100Hz. It sounds like power suply. I dont think so.

Pedro,
Is the microphone properly earthed and are you using screened lead? You
may be getting the 100Hz from your power supply. Do you have a 12V
battery you can test it with?

I can't help about the distortion subject. But if you notice 100Hz influence, take into account that received RF looking for a ground return, if traveling across the power supply will get modulated by the diodes! They are opening and closing the way back to the mains 100 times per second. I couldn't believe it: a Tx (AM in this case) with no hum, and a Rx with no hum, either from power supply ripple or tranformer's stray magnetic field, if the received signal was too strong there appeared a noticeable 100Hz in the loudspeaker that could only be cured with 0,1uF discs in parallel with the rectifiers. Give this a try.

Thanks, Thanks a lot!

I just tryed battery power suply. 14.4V from Black&Decker Drill. It was about 14.1V. The same distortion.
But noticed something else. The rig is receiving without antenna at all. The same #2 rig with Tx problem. May be bacause it is not yet in a box.... The box is not yet drilled
I have a heavy noise at my place. Including power lines about 20 meters away. All the apartment building (40~50 units) is connected ~15m away from my room.
(I Rx one paticular VHF repeater with the same ~100Hz "noise". Very heavy "noise", more laud than the repeaters audio. Few days ago they was changing a pole and cut the power and I received very nice audio from that repeater, that noise was gone. For awhile.)

So what I see is:
- no box
- heavy noise includig power lines
- no grounding at all

May be have to drill a box..

.....
.... after hour or two
Just checked Again. May be it is not 100Hz modulation. Naw it sound to me like common overdrive distortion. I am not deep into terminology, I mean when the signal is too big for the amplyfire to handle. Rx is good.

From: Steve Drury
Topic: 3024 Message: 3024

For a long while I've had problems getting the cases I use for SWR meters and the MKARS80, for the MKARS80 this has been solved - I have had manufactured a quantity of quality cases which have all the holes laser cut... no more drilling! As you would expect bespoke cases are expensive but for the MKARS80 kit I have been able to retain the old kit price, the boxed version now comes with knobs included.

Boxes are finished in a textured white polyester finish, these aren't screen printed with labels so you can still add the personal touch with your own panel overlay.

Hello Peter,

As a service to existing customers I will sell them at cost price of £17
+ postage and PayPal fees, if in the UK you can avoid the PayPal fee by
doing a direct bank transfer.

If interested please send me an email - DO NOT make a PayPal transfer
without me knowing or it may go to the wrong account.

Hi Steve

Very many thanks for the swift reply. I would indeed be very keen to purchase one of the new cases and am happy to pay by direct bank transfer please.

If you could please send Sort Code and Bank A/C number to g8jcf (at) g8jcfsdr (dot) dyndns (dot) org together with the total amount payable and a reference code, then I will do the bank transfer.

Is that OK with you ?

Many thanks

Dean (and everyone else),

Cases are available; for this batch only I will sell them at cost, which with postage and Paypal fees is GBP 22 to UK and Europe and GBP 23 international.

If you want a set of knobs and rubber feet these are an additional GBP 2.00

Let me know if you want one and I will send you Paypal invoice.

3033. SWR/S/Pwr meter - how can I build one

Yahoo group: mkars80
Date: 2014-03-16 05:09:38 UTC
From: <petro.1968@...>
Topic: 3033 Message: 3033

I want to build an SWR meter. This is my main question. I already bought tiny ammeter (100microA) And search on internet. This looks good to me (VK5AJL - Build your own strip line SWR meter) .

Another itchy question. How the S-meter works, where and how it is connected.

Thanks. Peter.

Topic: 3033 Message: 3034

Hi Peter,
What frequency do you want to build an SWR meter for? For each band of frequencies (HF, VHF & UHF) there are different circuits which are appropriate.

An S meter normally measures the AGC (automatic gain control) voltage and uses this to drive an indicator.

If you haven't already got it / them I would recommend from the RSGB the "Radio Communication Handbook" and the ARRL "Handbook for Radio Communications" , another excellent publication is EMRFD (Experimental Methods is RF design). All are quite expensive but you can often pick up old copies at junk sales.

Hope this helps.

Peter,
Take a look at the Oak Hills Research WM 2 QRP Wattmeter. It accurately reads QRP power forward and reverse and it was fun to assemble the kit.

Sorry don't know your name!

I must confess I've not had that problem before... having a think then will come back to you - until then can you check all the voltages in the table, this could point to a problem.

From: Steve Drury
Topic: 1707 Message: 3040

There have been about 1500 MKARS80 sold so its inevitable that they
appear for sale on ebay and at radio fairs etc. - there appears to be a
well built one for sale on ebay at the moment, see:

Hi, I fixed my #2 rig. It was transmitting at very low power. Good felow handed me an osciloskope and I found that the final transistor did not amplyfy. I changed and it worked for a while. then the fuse went off. changed the fuse and transistor and now it works. forgot to check again the voltages on the final.

3042. BFO Calibration. Help...

Yahoo group: mkars80
Date: 2014-08-23 18:45:45 UTC
From: n.tooby@...
Topic: 3042 Message: 3042

Page 12 of the V1.3 manual... have set up the tuning range no problem but the BFO is problematic.I tried option 2 first and when I'd adjusted C83 for a clear signal asll it had done is shift the frequency up by 250 Hz. I though the point was that the frequency stayed constand whilst the BFO was adjusted?

So, on to option 1 (adjust for 10 Mhz measured at "TP 10 Mhz"). Forgive my ignorance, but where exactly do I stick the probes to do this? Is there a helpful picture/diagram anywhere?

Yours thickly (lol)

Hi

It's a long time since I did this but the test point is on the opposite
side of VR2 to the Xtal.
If you look at the layout on page 25 VR2 is at the 3 o'clock position
and the test point is just above it next to C48.

Regards,
John

Steve,Many thanks for that. Sorted. We am now on the final stage of testing... working through these with my Wife and Son who are building these kits for the intermediate assessment; so two builds on the go at once.

Ok, so we're all ok up to page 3 (R2 bias current) On kit 1 the RCV drain is 108.9 mA and on XMT (LED lights) the drain rises to 300 mA with R2 fully anti-clockwise. turning R2 clockwise in small increments seems to have no effect at first but then jumps to 500mA, so a 50 mA increase is not attainable.

On kit 2 the RCV drain is 109.2 mA and this rises to 220 mA. R2 seems to have no effect.

In testing, we have only ever keyed for a flash to test the current (2 sec max) tweaking R2 and then re-keying to test current drain.

So, we connected a dummy load and power meter to both kits, keyed and spoke to mic. No output on both, so they are not transmitting anything. The interesting thing was that between the R2 tests this morning and the XMIT test just mentioned, the LED on kit 2 now refuses to light.

All is still ok on the receive and tuning though....

I have again inspected for dry joints but can't see any obvious candidates for the two of them to fix. Any thoughts?

Nigel,
When setting the bias always have a dummy load fitted. Adjust the preset whilst transmitting as it will be very sensitive. More via private email.

From: do1rvd@...
Topic: 3047 Message: 3047

I got through the assebly without any bigger difficulties, until I got to the Polyvaricon. The contacts of the Polyvaricon are to broad for the holes in the PCB.

I tried to press them in with a little bit more force but had no success. So my next try was to fold the contacts with a plier, so they fit through the holes. This didn't work either.

Ideas are welcome.

Thanks, Rolf

Hi Rolf, unfortunately the manufacturer varies the width of the terminals...if you are unable to trim the terminals with a pair of side cutters I can send you one which will fit the board without further modification.

Sorry for your problem,
Steve G6ALU

Hi Steve,

as the terminals were already a bit stressed by my folding attempts, trimming the terminals with a side cutter didn't went well. Two terminals broke off with 2mm length left. I cropped all three terminals down to that length, bended them 90 degrees and soldered them flat on the soldering points on the component side of the PCB.

With the Polyvaricon held through the two screws, I think this will work as long as there is no torsion or tensile stress on the joints. Just as safety percaution it would be nice if I had an Polyvaricon as spare part.

I already planned to order the Digital SWR Meter kit, so you can put it all in one delivery. I will place the order later today. We just need to find a way for the payment for the Polyvaricon. If you tell me the price I can pay it via paypal.

Thanks in advance,
Rolf DO1RVD

Alternatively, trim the polyvaricon leads so they just reach the board
and then solder wire spills through the holes and to the leads.

Simon, most software has an invert function...for PSK31 etc you don't need to change the sideband.

I guess it is possible, needs the carrier insertion oscillator pulling (lowering in frequency) to the other side of the carrier, note that the crystal filter is only really suitable for LSB as it has a sharp cutoff on the lower frequency side - the mixing process generates a USB IF from the incoming LSB signal.

Hi Simon,

In the past I've successfully run my mkars80 in digi modes, the only problem that I experienced was frequency drift due to over heating.

To reduce the heat build up I fitted a small fan from an old PC mother board, I also added a series resister to the 12V fan as the mkars80 supply was 15.5V, fitting the fan cured the frequency drift.

Regards,

Phil

3055. Anyone Finish Blazing the Trail for 40 Meters MKARS Mod?

Yahoo group: mkars80
Date: 2015-03-29 08:01:38 UTC
From: Wayne.A.Wheeler@...
Topic: 3055 Message: 3055

New ham looking to build an MKARS for SOTA activations. I have a TenTec Rebel for CW, but my CW is not yet up to par yet!

Things I like about the MKARS
- Club heritage (Epiphyte)
- Integrated frequency display
- Great build instructions
- Great reviews
- British :) Add cool factor for us yanks :)
- Huff and puff stabilizer
- New "no drill" 3D printed enclosure
- Small size and power perfect for SOTA
- Very reasonable price
- Great community (this group)

Things I don't like
- No 20/40 meter - to my limited knowledge, 80 meter would just not be "open" to provide many contacts mid day when you could find your way on top of a mountain for SOTA activations.
I know electronics, but have limited hands on radio experience. I could certainly sub parts, but do not have a way to burn a new PIC controller at present. (I think someone found 40 meters required a different IF frequency?)

Any help appreciated, or maybe a 40 meter version may be in the works.

Thanks,

Wayne

From: matthewklumper@...
Topic: 3056 Message: 3056

Hi, thanks for adding me to this group.

I recently completed the component portion of the MKARS80, and started testing it. When I initially started it up there was no noise except a small pop from the speaker and a low static noise. I tested my voltages and they looked good, but then there started to be a faint whining noise from the internal loudspeaker i had wired up. A few seconds later the faint whine became a loud whine and now it does that whenever I apply power.

The internal loudspeaker had fallen down from the top of the board where I had it balanced and it's back was against the polyvaricon. Actually the magnet was even stuck to it a little. Could this be what caused the problem? Does anyone have any other ideas?

Hi Mathew,
Sorry about the blank email....!
First place to start is by taking voltage readings, the polyvaricon is DC isolated so you shouldn't have damaged anything in that circuit. You may find that the problem doesn't have anything to do with your little "accident", if not I would check the connections on all the mixer transformer wires as poor connections here is quite common.
Let us know how you get on.
Regards,
Steve G6ALU

Ok, I checked my 5v at R34 and it read 5.04, and my 8v at VR2 and got 7.95v

I double checked all of my solder joints and reflowed anything suspect. When I applied power again, I got the same thing. Checking for presence of power at the (+) and (-) for the internal loudspeaker gave me a reading of 4.84 volts. So that's not right at all. Any insight as to where I should start looking for what's causing this?

Matthew,

With no external speaker connected you should get 0V on both terminals
of the internal speaker - if you have voltage there check C2 for correct
orientation and solder splashes across its solder pads.

Steve

C2 checked out fine. I also took it out of circuit and tested it and it looked good.

Something strange though, when I touch the top right solder trace of the polyvaricon with my tweezers, the beeping stops. that's without touching anything else, either. In fact if I follow that circuit all the way through until q12 doing the same thing, the beeping will stop but the static will sound differently depending on where it's being touched. Like I said before, I'm ONLY touching one solder joint at a time and nothing else. Is it possible that my incident with the speaker shorted the polyvaricon? How do I test it?

I took the polyvaricon out of the circuit and tested from center point to right and then left pin. (Please let me know if I'm doing it wrong, I've never used one of these before) It read nothing on any combination of pins while it was sitting on the bench, but if I touch the post it will start reading up to 300uF for a half second, then 0uF, then back up to like 50uF, and so on. It jumps around like that when reading on my Fluke 12 multimeter, and doesn't read anything at all when I test it with my eBay special LCR meter. (I'm guessing it's jumping too fast for the latter to read) Anyway, I thought maybe this info could be useful.

When one gets jumping readings as those you mention, touching a part, it's because the measuring instrument is being fooled by hum. The 50 or 60Hz mains cables around you capacitively induce some AC in your body, and you transfer it to the instrument. Depending on its design, it may be more or less susceptible to mains influence.
I don't think the louspeaker falling into the polyvaricon has to do with the problem. Most probably the shock loosened some weak solder joint somewhere in the PCB.

Matthew, I'm trying to decide where this whine is originating - is it very loud - if you have a modern phone do you want to video it and send the file directly to me?

Matthew has not mentioned how he is powering his radio, I would try powering it from mains and then from a battery. If the whine is the same from both power sources then try it in a different location ie the end of the garden. Reasoning behind my suggestion is I have just built a sw regen and had similar problems, I tracked mine down to a pair of PLA's putting broadband Internet through the house wiring. If your noise still exists after trying the above at least you will know that it is a problem with the circuitry. Fault finding starts with eliminating the obvious.

I soldered the polyvaricon back onto the board so that I could try some of the above suggestions and take a video to send. When I hooked it up to a battery and turned it on the noise was gone. Then, out of curiosity I hooked it up to the power supply again and the noise was STILL gone. It would appear that I had a poor solder connection at the polyvaricon that was probably aggravated by pulling on it with the magnet or something

It's pulling in stations nicely. Thanks for all the great tech support. I'm off to start aligning it now.

Topic: 3067 Message: 3067

Hello, Yesturday I tryed again my second tranceiver with zepp antenna. The antenna try was disapointing but I noticed that my radio display, receive and transmit on about 200-300Hz above the friquence I receive.

The station\s was on 3.710.000Hz but I receve them best on 3.710.2++
When transmit, they say I am above theyr frieq.

What may be the problem?

The first radio is awsome! I install internal speaker from laptop an microphone from a cheap headset.
And is working flawlessly. It covers Bulgaria and neighbors. I tried it with horizontal V 3-2m above the grownd.

Regards,
Peter

Hi Peter,

The MKARS80 uses the same VFO for transmit and receive so it shouldn't transmit on a different frequency to it receives. Can you check the following; when going from receive to transmit do you get the unlocked "U" on the second line of the display? If not then the frequency hasn't changed.

Was the BFO set for exactly 10.00MHz at TP10MHz? If you adjust the BFO oscillator for best audio this may not be the exact frequency.

Regards,
Steve G6ALU

MKARS80Would an internal speaker cause de-tuning when in use, and perhaps not do this on TX (if changing TX/RX is changing frequency?)

Yes but not sure if this is the issue - if the huff and puff becomes unlocked (look for the "U" in the display) this may be the case.

From: petro.1968@...
Topic: 3067 Message: 3071

Thank you very much Steve! Recently I had time to go out and do the ajustment. It was easy thanks to you.

Would be nice to use some fine equipment like freq. counter, but using my ears I make it good enough. May be not more than 50Hz off.

Thank you very much once again.

My best regards,
Peter VE7BUL

3073. PA Bias current adjustment.

Topic: 3073 Message: 3073

Chaps.
I've acquired a "pre-built" MKARS80 and I'm having trouble setting up the bias as instructed.
If the PPT isn't closed I get a reading of 110 mA, when the PTT is closed (no audio) I cannot set the bias with R2 to anything less than 280mA.
The TX audio is also rather awful. I have tried two different mikes.
I'm pretty sure both of these problems will be connected.
I've checked all solder joints and even replaced the IFT510.
All other set up work fine.
Any ideas?
Rick.

Hi Rick, 280mA with PTT pressed sounds normal - to adjust the bias with no audio increase the current by 50mA IE 320mA.

From: andyakashrek@...
Topic: 3081 Message: 3081

Many months ago I bought the MKARS80, swr meter and CW adapter, I have only just got around to building them. I have just finished the transceiver and have a question, I have no output power to a power meter feeding into a dummy load, I will check voltages at Q1 tomorrow to see what I have, is it possible to have a dud final transistor. The radio is boxed and Q1 mounted to chassis.
It receives Ok, the led lights on keying the mic but does not flicker when talking, my FT817ND can hear a steady carrier but at a constant S9. Bias set correctly.

3082. Re: [mkars80] Q1 dud?

From: Steve Drury
Topic: 3081 Message: 3082

Hi Andy,

If the bias sets OK - that is a 50mA current rise as you rotate the preset resistor clockwise - it's drawing current so not faulty. The most likely cause is that one (or more) of the transformers has poor soldered connections. First do a DC voltage check on Q5 and Q9, each should have voltage on their collectors, if this doesn't reveal the problem check the connections on both of the mixer transformers. If you still have no success please contact me by a private email so I can get it going for you.

Regards,
Steve G6ALU

I have just finished the transceiver and have a question, I have no output power to a power meter feeding into a dummy load, I will check voltages at Q1 tomorrow to see what I have, is it possible to have a dud final transistor. The radio is boxed and Q1 mounted to chassis.
> It receives Ok, the led lights on keying the mic but does not flicker when talking, my FT817ND can hear a steady carrier but at a constant S9. Bias set correctly.

Hi Rick,

Are you sure you have the CIO/BFO set correctly? How do other stations sound? Like a Dalek too?

I suspect that it is set incorrectly, not sure how the manual has you do it; you can try to set it by ear so other stations can be tuned in to sound natural. Another clue to a good setting is that the background band noise should sound "normal" ie. not super high pitched and not low pitched/hollow sounding. Also, strong CW stations tuned in should show just a very little bleed through on the opposite sideband.

Hope this helps,

73,

Mark.

Rick, I don't remember now but did the bias adjust correctly? Does it produce around 5 watts and are you using a standard electret type microphone? I wouldn't describe TX audio as HIFI but often gets complements for its good quality..

Rick,

I don't know what it could be - have you any way of recording the audio
so I can hear it myself? Just a thought - are you using screened leads
for the microphone and is it in a standard case (one I supplied).

Steve

Hi All.

If this is a transmit fault I assume that you are hearing the poor quality audio by monitoring on another receiver.
Sounding like a dalek is a pretty good description of an SSB signal being received on an AM receiver.
If you are monitoring with another RX (and please don't be insulted as I am simply trying to think of a cause for your problem) are you monitoring on the correct sideband ie transmitting on LSB and monitoring on LSB and not monitoring on USB or AM?
If you are using LSB to receive then have you tried monitoring using a receiver with basically no antenna (or even with the receiver antenna input grounded) to ensure it's not a problem due to the MKARS80 overloading the receiver front end?
Has anyone commented on your audio off air other than the wife? How was she monitoring your transmissions?

Thanks for the offer Steve. I'll run it through the workshop again and have another go at it.
I'm pretty busy with other projects at the mo, so this was put back on the self.
I'll drag it back out.
The unfortunate thing about it is, I didn't build it, so you can never tell if it was just a simple build fault, or something else.
I have a good look round for bad joints etc, but nothing jumps out at me.
Thanks for all the suggestions chaps.

Rick.

Hi Rick.

I hope you sort it out and then post the result on the forum.
I've had 3 MKARS80 : One that I built myself and two others that I had to repair for people who'd looked like they'd soldered them with one of the old 'heat on a gas ring' irons.
I know Steve has asked for a recording of the way it sounds and I'd love to hear it too.
Perhaps you can post an audio file on the reflector. I know the reflector handles .wmv files.

I wait with interest

3099. Unstable frequency/vfo

Yahoo group: mkars80
Date: 2016-02-06 09:27:47 UTC
From: oh7lbj@...
Topic: 3099 Message: 3099

Hello all,

I finished my v1.3 MKARS80 few weeks ago, added a fan and power switch and finally made a decent antenna for it last week.

My initial goal is to make a BBS/Node/digital-something station that will be portable/mobile and fit into a tool case or briefcase/etc. MKARS80 seemed to be perfect for this use.

However, I noticed the frequency tends to crawl or jump. It is not stable at all.

I read from the manual, that it will take some time before temperature inside the case (recommended case) will be stabilised and hence for first 30 mins or so the vfo will be unstable.

Unfortunately, it looks like it still, after a long time period, is unstable.

Last night I left my MKARS80 on after some 1-2 hours of testing it. I set RF 3593kHz (+/- 10Hz) when I left and this morning the frequency was about 3595kHz give or take some. So the drift was about 2kHz during the night!

What can I do? Could it be caused by the fan? It is quite powerful little fan (maybe 40mm) and placed quite close to the FET at the side of the case.

I have tried three different voltages to run it, 12V, 13.5V and 15V, no affect to the frequency drift. 15V gives me nice 7-8W of xmit power though :)

Like it is now, it will not be ok for my project as it will be left alone for long periods.

Thanks in advance for all help,

73de OH7LBJ / Janne

Hi.
I have built two of this very nice qrp transceivers and used them a lot. I had a small problem with stability at the beginning with the first one. I did not notice the + sign in the display was missing. When this sign is presented, the frequence is locked an should be stabile.
To be able to lock the frq. I did som adjusting on the occillator limits.
So try to do some tuning to be shure the occilator work within the actual frq.band and check the level is high enough. I don't know if this will help you, but check and be sure you see the +sign in your display.

I am not sure why you would add a fan. But pay attention to the +/- to make sure it is stable to start.

I would only consider adding a fan it it was to be used for digital modes.

I added the fan, as it is recommended for digital modes. This will be basically used only for digital modes.

And yes, I have been checking the appearance of the plus sign. I will keep investigating this, yesterday it held the frequency nicely for some hours during the day.

If necessary, I will change the VFO to DDS VFO or something.

Hi to all,

Google AA7EE article (The DSB80 – A Direct Conversion DSB Transceiver for 80M By G4JST and G3WPO – First Stage Of Buildingstable VFO) and you could find similar VFO solution as MKARS has, but using JFETs, which are much more temperature stable than bipolar.
I did modification in this way and I have less drifting problems after some time.

But you have count also other facts for stability (CRYSTAL SETS TO SIDEBAND
© Frank W. Harris 2010, REV 12 Chapter 10 Variable Frequency Oscillators (VFOs))

I also noticed that Q13 heats little bit too much. I am working on 13,5V and current is under limits.

3107. Help request with cheap amplifier kit

Yahoo group: mkars80
Date: 2016-06-08 10:19:43 UTC
From: Matty Cunningham
Topic: 3107 Message: 3107

Hi,

I have recently purchased one of these kits from China, to hopefully get a few more watts out of my MKARS80 kit:-

http://www.banggood.com/DIY-45W-SSB-HF-Linear-Power-Amplifier-Amateur-Radio-Transceiver-Shortwave-Radio-Development-Board-Kit-p-1018834.html

There's a good translation and English version of the manual available here:-
http://www.caarc.ca/wp-caarc/wp-content/uploads/2016/03/Banggood-IRF-530-PA-Instructions-V1.4-.pdf

This requires 1-5mW drive to give 40 or so watts output – does anyone have any suggestions on how I can drive this?

I could use a resistor network to drop the output from the MKARS80 to a suitable level, but if I'm going to operate portable – it seems a backward step taking around 5W and having to dissipate this to a level suitable for the amplifier and will shorten battery life.

Would it be an idea to bypass/remove the IRF510, or take the output from around T1 on the MKARS80 to drive the amplifier, or would it be worth me looking at driving the amplifier where the 2SC1971 is on the amplifier board?

I'm note familiar with impedance matching for transistors, so any advice on how to help hook up my MKARS80 to the amp will be much appreciated.

I understand I'll need a way to switch the amp in/out of circuit and will need filtering on the output stages.

Many thanks

Matty

MD0MAN

There’s been some discussion about this amplifier on the RSGB Tech forum recently that has some comments and concerns about this amplifier. I’ve copied one of the posts below.

As far as your specific query is concerned, the simplest way would be to put an attenuator on the input SMA or between the input socket and C12. You need 26dB, i.e. 400:1. Made from E12 series resistors in the classic Pi format you’ll need 470R + 27R in series to make R4 and two lots of 47R + 8.2R in series to make R3 & R5.

73 Clive

G3GJA

Hi Ian.

I have one of these and its actually quite poor.

I had to rewind most transformers as its gain dropped very sharply under 2MHz and I needed it to work down to 1.8MHz.

The second stage transistor uses an obsolete, CB PA transistor. The one supplied had been previously used and measured low gain.

There is no bias temperature stabilisation on the output pair. The quiescent current varies excessively with temperature.

Apart from the above, it just about works..:-)

Hi, the easiest way of driving the amp is to remove the output transistor. Measure the signal across R1 and using the measurement build a suitable attenuator to drive the PA. Its probably possible to use R1 as part of the attenuator.

Subject: RE: [mkars80] Help request with cheap amplifier kit

There’s been some discussion about this amplifier on the RSGB Tech forum recently that has some comments and concerns about this amplifier. I’ve copied one of the posts below.

As far as your specific query is concerned, the simplest way would be to put an attenuator on the input SMA or between the input socket and C12. You need 26dB, i.e. 400:1. Made from E12 series resistors in the classic Pi format you’ll need 470R + 27R in series to make R4 and two lots of 47R + 8.2R in series to make R3 & R5.

73 Clive

G3GJA

Hi Ian.

I have one of these and its actually quite poor.

I had to rewind most transformers as its gain dropped very sharply under 2MHz and I needed it to work down to 1.8MHz.

The second stage transistor uses an obsolete, CB PA transistor. The one supplied had been previously used and measured low gain.

There is no bias temperature stabilisation on the output pair. The quiescent current varies excessively with temperature.

Apart from the above, it just about works..:-)

Reduce the backlight display adjustment pot until you get the correct
display.

Thanks to all for the replies.

I will build the PA as is, some filtering and see how it is with some test equipment and take it from there.

My idea was to use it for portable operation, rather than heating up a bunch of resistors to give the attenuation required, I'll try Steve's suggestion
as this should give me a better battery operating time.

Kind regards

Matty

John, there are no links that have to be made, perhaps these are tracks on the top side of the PCB. Have a look through a magnifying glass, it may be difficult to see as it will be covered by solder resist (green paint).

Steve G6ALU

>I have nearly completed my pcb (ver 3) and note that there are some locations that appear to be for wiring links,
> one near c18 and the other 3 near the relay. I can find no reference to links in the manual and several photos of completed boards appear to show these locations unfilled, They appear to have very little ''land'' to solder onto. I will check through the wiring diagram but in the meantime if anyone can explain what they are it would be a great help, I expect I am missing the obvious. John

John,
Have you adjusted the BFO for 10.0MHz? I've had instances that the oscillator frequency passes directly through the filter pass band and can cause instability, this disappears once the BFO is set correctly. First mixer ballance also plays a part here.

Subject: [mkars80] bia setting

I have completed my kit up to the point of setting R2 bias, it receives very well so there does not seem to any problem there. I do not have a mike as yet but have wired up a microswitch for ptt onto the mike plug and followed instructions for setting up bias (Page 13). The keyed bias is 230mA but any attempt to raise it to approx 285mA as yet unsuccessful, there is not variatation even after about a 1/4 turn of the trimmer then the current raises suddenly to about 375mA, turning back the resistor drops the current back to 230mA but on releasing the ptt and pressing it again the current is back up 350mA plus. While the is happening there is a very faint fluttering sound from the speaker which I assume is oscillation feedback, the problem is there whether the unit is cased or uncased. It almost seems it there could be a flat spot on the trimmer but thats just a guess. Advice gratefully received. John

---- jpowell700@yahoo.com [mkars80] wrote ----

>Hi Steve thanks for getting back so promptly, tried your ideas. BFO is correct at 10 Mhz and tried to check carrier balance on scope but this does not seem to make any difference. Just to satisfy my thoughts I changed R2 but it was same result so I put the original back in, I also changed the 510 with same result. It is possible to raise the current to 285mA from 235mA on R2 but as soon as the ptt is released and pressed again the current has risen back to approx 750mA on my avo. There does not appear to be any gradual adjustment on R2, it seems that it takes about half a turn before any current raise to 285mA and then as I said once the ptt is released and re-pressed that value that was set has gone. I have checked the componants in the bias chain to the PA and these are correct. No doubt something I have overlooked ,I will set it aside for a few days and check again with renewed energy HiHi, regards John

Hi,

Just completed my mkars80 and have enjoyed the build very much. On completion at 3am Saturday morning I made several contacts including Kazakhstan, Russia and Canada! Over the last few days I've had several long inter-G contacts without any problems.

This evening I made a few tweaks to the mixer balance and BFO frequency and powered it up. For some reason it seems the huff and puff no longer works. I have re-tweaked the earlier adjustments but can't seem to get any improvement. Any help getting this fantastic little radio back on the air would be much appreciated.

Tim

Hi Tim. First what is the display telling you? When in lock you get a bar which moves either left or right depending on the correction it's applying. If it displays a"U" then it's unlocked.
Is the micro fitted into its socket Correctly.

Hi Steve. Thanks for getting back. It would briefly lock then stay on U for most of the time. Previously I could watch the bar and tweak the tuning back to centre. Having said all that, I put it over a fan for a while to be sure it was cool and I've just had a 20 minute qso! I've just given the micro a bit of a push and it did move a tad. If you happen to be near a radio I'm on 3.783.

Thanks Steve. I've checked the BFO freq and it sounds the same. It may just be how they normally sound, I've never heard another one. A friend built one some time ago, he's going to fire it up and give me a shout so I can hear what his sounds like. The frequency instability seems to have gone for the most part. It has done it again but it went away when I gave the tuning a good twist.

Hi Steve, thanks for your reply. My antenna is just a home made double bazooka type dipole. I doubt the fact it's a double bazooka makes it any better than a standard dipole. The entire length is up about 12m which probably does help a bit.

I should maybe have mentioned earlier that this kit was originally purchased in 2009 so may be running old code. I mentioned to a friend I was waiting for the kits to be back in stock. He said I could buy his un-built one for the original price, so I did.

Got it, thanks. Should I run the whole display off the 12v supply or just the backlight?

My original plan was to change the fine tuning pot for a 10 turn one. Turns out that wouldn't fit in the standard case either so since I had to change the case I thought I may as well put a backlit screen in too. I read in another post you recommend rotating the polyvaricon and extending the shaft over using varicap tuning. Are you still of the same opinion?

Only drive the backlight LEDs with series resistors from 12V. You will destroy the display if you drive the logic side in the same way. I liked the rotated Polyvaricon idea but not tried it myself.

>My original plan was to change the fine tuning pot for a 10 turn one. Turns out that wouldn't fit in the standard case either so since I had to change the case I thought I may as well put a backlit screen in too. I read in another post you recommend rotating the polyvaricon and extending the shaft over using varicap tuning. Are you still of the same opinion?

3151. Any kits due ?

Yahoo group: mkars80

3154. Pic Osc

Yahoo group: mkars80
Date: 2016-12-19 21:38:32 UTC
From: tasmod@...
Topic: 3154 Message: 3154

Steve,

I wanted to do some bench testing of the Pic. Due to the code using an external osc input I needed to use a 10MHz crystal to generate the Pic clock.
I altered the asm code to XT osc but it just wouldn't run on 10MHz so I tried HS. This worked but it just displayed the welcome message and then did a restart and appeared 'flakey'.
I'm very rusty on asm now as I've spent so long on Arduino. Is there something I'm missing, a bit setting or such ?
I have the crystal on pins 16 and 15 with two 22pF to ground. There is 10MHz on the scope so it's clocking OK.

Rob G4NQX

Sorted, not a software problem. A decoupler cap leg had come of the board and there was noise on the supply.

3157. Working with the torrids

Yahoo group: mkars80
Date: 2017-03-04 03:06:24 UTC
From: Mike Lichtman
Topic: 3157 Message: 3157

I am currently putting together a MKARS80 and would like to know any hints for removing the enamel. I tried a flame from a lighter and then light sanding but it doesn’t seem the best way. Can someone share from their experience and also hints on mounting the toroids. The # 38 wire is not kind to older eyes or much fussing with. 73 Mike KF6KXG

Hello Mike,

My experience with toroids has been with heavier gauge wire.

To mount my toroids I use a cotton-wool bud (the plastic stick, cut to somewhat longer than the height of the toroid. Then I fix two buds to the toroid with cotton and nail-polish. When finished the toroid former will stand on the two plastic "feet". I use the "feet" to mount the toroid on the board.

The method I use for stripping the enamel from the wire is like yours - but I use finger-nail emery boards. I use a finger to hold the wire against the emery board. As I said before, I didn't use gauge 38 wire - perhaps only 0.25mm. (Maybe #30 or 32. I don't know).

Les

Best way is to use a very hot soldering iron - I melt a blob of solder on to a heat resitant surface and while the iron is still heating the blob pass the end of the wire into it. For heavy gauge (22 SWG) I crush it in the serated part of some universal pliers (the gripping part) first.

From: ohwenzelph@...
Topic: 3157 Message: 3164

I use a "razor blade", (not found in razors anymore, you have to go to a hardware store) and scrape the wire. What is better is to find some "heat strippable" wire that is easily stripped with a blob of hot solder. TIN the wire ends before you try and mount the transformers on the board. I didn't and tired to tin as i soldered it and it was very bad for the pcb traces. Near disaster. Likewise don't solder the red led or the IRF510 to the board 'till you have figured out the mounting in the case. trying to unsolder and adjust the positioning is not good. solder them in the perfect position and then test.

Hi,

If I use a razor blade, I often use the cut edges of it instead of the blade part. The sharp 90 degree corner on the cut edges works like a cabinet scraper, so it scrapes off the insulation better with less risk of cutting the thin wire. This works with many types of blades like Exacto and utility knife blades etc. -- they all have sharp edges where the blades were cut out of the steel sheets. I use a rubber mat underneath too, so that the wire can sink in. This helps prevent damage for when you accidentally press too hard.

When mounting the toroids, be careful how far you pull the wire ends through. Sometimes you end up pulling all the tinned end through the hole and you end up with having un-tinned wire again!

73,

Mark.

The wire in MKARS80 kits is heat stripable....you need an iron temperature greater than 390 degrees centigrade.

One more thing, the lateral leads on the polivaricon are too wide to fit thru their pcb holes. I bent those leads back and used pieces of component leads like what is done for VR1 and VR2. I think it would be better to find a way to cut them a little narrower so they fit the holes.

I often find the holes on PCBs [all projects] are smaller
than the leads on trimmers, polycaps etc' . I usually solve
this by filing the leads down to fit but using wire spills is
also a good method providing they can take the torque
required to hold a trim cap whilst it's being adjusted.

Unfortunately rhe manufacturer has mixed batches of capacitors, I trim the with of the leads with side cutters but bending them up and connecting with tinned copper wire seems a good solution.

Hi,

For trimmers with too wide flat leads, I often squeeze them with a long-nose pliers so that they fold in half long ways. Start at the end with the edges in the grooves of the pliers. Sometimes it helps to push in the middle a bit with a small screwdriver.

Also, sometimes you can just widen the hole a bit in the direction needed by using a small screwdriver or a sharply pointed knife blade. Widen one side, then flip the blade 180 degrees and widen the other side. Then flip the board and do the same coming from the other side.

73,

Mark.
